FOR SALE.

One Upright Post Drill, Putnam's manufacture, Also one thirty inch screw Chuck.  
San Francisco, July, 1883. je13

50 lbs. MARINE and

Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

## DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed oil.

For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

## DIRECTIONS:

HOUSE--Mix three parts Mineral Paint with one part white lead, thin with Linseed oil; if a lighter color is wanted, mix less paint, more lead.

ROOF--Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. FOUQUE, Superintendent.  
WORKS, North Beach; Office, 509 Sacramento st., San Francisco.

## WRIGHT'S PICKS.

**IMPORTANT!**

To Mining Companies, Miners,  
Prospecting Parties, Commanders  
of Ships, &c., &c., &c.

**THE UNDERSIGNED HAS RECEIVED**  
a new supply of the celebrated

**DESICATED AND COMPRESSED  
VEGETABLES,**

Of Messrs. CHOLLET & CO., PARIS, which he offers now  
for sale in lots to suit.  
These Vegetables being perfectly fresh and sweet, are  
the best preventive of scurvy and other diseases result-  
ing from the continued use of salt provisions.

They are already cleaned and prepared for cooking;  
are perfectly preserved, and offer great advantages for  
transportation. 25,000 rations being packed in the space  
of one square yard, while 2,000 rations—or equal to 1,000  
lbs fresh vegetables—weigh only from 100 to 125 pounds.

**CHARLES MEINECKE.**

**Eye, Ear and Throat.**

**DR. DE CASTRO,**  
Oculist and Aurist,

**WHO HAS PRACTISED IN NEW**  
York and all the principal cities of Europe with  
such unrivalled success, and from each place is in posses-  
sion of the most eminent testimonials, may now be con-  
sulted upon diseases of these delicate organs, with a view  
to their permanent cure. Drafts of long standing thor-  
oughly cured. The Doctor employs his (by the Medical  
Society of London approved)

**Self-adjusting Artificial Tympanum,**

For the relief of deafness, attended by loss or injury of  
the membrana tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of the  
paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state; the effect of the tympanum was instan-  
taneous—quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

**Mr. Editor—Having been afflicted**  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it is with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to recom-  
mend Dr. De Castro's skill as an aurist.

JOHN REESE, Napa Valley.  
James Callaghan, witness.  
San Francisco, July 30th, 1863.

[From the Daily Alta.]

San Francisco, June 30th., 1863.

**Dr. De Castro's**

Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearny and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly; and is now, I am happy to state in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro, for  
his skill; and would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skillful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT,  
812 Green Street.

**MINING CERTIFICATE LOST!**

York River, gold and silver, John Gorman, 423 Battery street.  
Young America Ocher, gold and silver, Amador Co. G J Turner, 606 Montgomery street.

Zephyr, gold and silver, Lyon Co. N. T.

**WEALTH OF GOLD HILL, SONORA COUNTY.**  
We clip the following from the "Sonora Flag," of July 30th. "Under the energetic and capable superintendence of N. P. Turner, Esq., the Gold Hill quartz mines, immediately in this city, are developing astonishing wealth. We saw Mr. Turner with a tubful of rocks—the richest we ever saw—which were over half gold. Some had been broken with the pick, but so completely was it interbound by fibres of gold, that the fractured pieces refused to come apart. A 'breakdown' in the mine, day before yesterday, displayed the shining particles, on both sides and above the drift. The shaft is in the immediate vicinity of the place where the prodigious strike was made, a few years ago, and is actually on the same vein. The owners have about as good a thing as they want, and refuse to let any of the stock go into market."

**RAILROAD HOUSE.**—Our personal friend, Mr. H. T. Fulron, has lately purchased a half interest in this Establishment. From considerable acquaintance with Mr. F., we know no man, more capable of "keeping a hotel" in first class style. Under the present management, the RAILROAD HOUSE is second to none, in all the requisites of comfort and convenience, and we trust our numerous patrons in the country, will be advised by us, and on visiting San Francisco, give it a trial.

**RICH.**—We saw a small silver brick, the past week, weighing 6 oz, taken by Varney, from 50 lbs. of average rock from the Minna del Norte mine, situated in San Antonio District, Lower California, about 20 miles from Ventana Bay. This is a newly discovered mine, located by a San Francisco Company. The rock thus tested by Mr. Varney, was a fair average for arastra working.

**REMOVAL.**—Messrs. Gallagher, Weed & Co. have removed their Brass and Bell Foundry from their late stand on Oregon St., to 125 Front Street, opposite Minna, where they are prepared to answer all orders in their line, at the shortest notice.

**SUPPORT HOME MANUFACTURES.**—All home manufactures have an interest to us, simply because every article thus brought into our local market is an addition to the wealth and importance of the State. For this reason we beg of our numerous readers to pay a visit to the trunk manufactory of Mr. James Longshore, under the Tehama House, Sansome street, where they will find the best workmanship, and cheapest goods of the kind, in the city.

**NEW OFFICE.**—Messrs. D. C. Williams & Co., Mining Brokers, have removed into their fine new office, No. 605 Washington street, between Montgomery and Kearney Sts.

We append in the following supplement, a list of Mines to which we have not yet obtained the names of Secretaries, and to a very large extent, even the locality of the mine is not known to us. They will be placed in the preceding Catalogue as fast as the necessary data can be obtained. The attention of Secretaries and other parties interested is called to the deficiency alluded to.

Alcyon, g & S, Big Creek District.  
Aladin, g & s, Smokey Valley district  
Apollo, g & s, Reese River district.

MR. EDITOR.—I see in your number of last week a notice that "the editor is absent," and in the same column, (page 4,) a letter from your correspondent "P." which implies that others, also, are at times "absent." I think that your proof reader must be answerable for the assertions in reference to No 2 and No 4 Sulphide of Ammonium and Chromate of Potash, although not commonly used as reagents for silver will produce the effects spoken of, but the absence of a precipitate with nitrate of silver is the test for chloride of potash as to its freedom from chloride. Some statements however of the properties of hydrochloric acid seems, to imply "absence" elsewhere.

A. POOR CHEMIST.

"A Poor Chemist" is correct in his surmises, and we owe our correspondent "P." an apology for the errors which we unintentionally allowed to creep into his communication.

DRY CRUSHING.—Messrs. Hotelling & Wheeler have recently invented and put in practical operation, at the Miners' Foundry, in this city, a battery of four stamps, designed for dry crushing. The battery, though quite a light one, is capable of reducing to an almost impalpable powder about four tons in twenty-four hours. We have neither room nor leisure this week to give this new improvement the description and notice which its importance demands. We shall endeavor to do full justice to it in our next issue.

OUR TRIP TO COPPEROPOLIS.—We have been so incessantly employed, since returning from Copperopolis, in preparing our enlarged Mining List, that we have had no time, whatever, to write out the notes taken on that trip. We shall endeavor to commence their publication, however, in our next issue.

An ingenious fellow is selling photographs of postage stamp size, with gummed backs, to be used as *prima facie* evidence of ownership when applied to "portable property."

Excellent clay for fire bricks, crucibles, and crockery, has been found in mining tunnels near Gold Hill, and a pottery has been established at Virginia.

NEW COPPER DISCOVERIES.—Rich discoveries of copper have been made near Cloverdale, in Sonoma county, and a new mining district formed. We were shown specimens of ore on Saturday which show indications of having been taken from a permanent ledge; the copper appears of very fine quality.

One firm of hardwaremen in Virginia have paid \$37,386 freight on 946,376 lb, hauled in wagons from Sacramento, at a price of about four cents per lb.

### OUR LIST OF MINING COMPANIES.

We have devoted nearly our entire issue this week, to our enlarged list of Incorporated Mining Companies. In order to make room for it we have been obliged to issue a "supplement" of four pages. The list, in its first issue must, of course, be quite imperfect; we shall take especial pains, however, to render it as correct as possible for our next issue. To this end we earnestly call for the co-operation of all parties interested. We shall endeavor, as far as possible, to wait upon them individually during the present week, and receive such corrections, as may be needed directly from their hands. Those Secretaries who may be personally interested in any needed corrections, and who may not be waited upon by Thursday or Friday, will confer a favor on us by handing in their corrections at the office, or forward them through the Post Office to our address.

We are fully aware of the importance of the publication of a full and correct list of Incorporated Mining Companies in the State and especially of those having offices in this city, and we shall endeavor to meet this want to the best of our ability. We hope by next week, or the week after, at the farthest, to be able to furnish our readers and the public with a list sufficiently complete and correct to warrant its transmission to friends at the East as an ocular demonstration of the extent and progress of the mining interests in the State. The issue giving the complete list will contain some appropriate remarks with regard to the character, importance and value of progressive and non dividend paying mines.

**RICH.**—We saw, on Saturday last, the tangible evidence of a very rich strike in the Rising Sun claim, Buena Vista District, Humboldt. This ledge is located about three miles from Fall's Mill, and bids fair to develop a valuable mine.

Rumor says that Joseph Trench intends to build a large theatre in Virginia, and to employ Charles Pope as Manager.

### Washoe Correspondence.

The following is an extract from a private letter dated Silver City, July 22, 1863, which has been placed in our hands for publication:

According to promise, I continue my correspondence, and without further statement of personal matters than I gave you in my last, I will give, as near as I can, a clear idea of the state of things in the Devil's Gate Mining District, as I know you are anxious to receive information upon which you do me the honor to say "you can rely." I made a somewhat longer trip through the mines of this district than I had first intended to do. There is no diminution in the flourishing prospects of Nevada Territory, if I am to judge by the enterprise that actuates the community of gold seekers at and about Dayton and Silver City. More mills continue to arrive and more machinery for newly developed mines, especially for Palmyra District. This newly discovered district has, within the last few months, made rapid progress. Many of the ledges have proven far more valuable than any had supposed or even expected. Large capitalists, I find, are daily investing large sums in this district, by purchase into various claims. Spring Valley has some very rich mines, upon which work is continued night and day. As you are aware this valley was prospected three or four years ago, although little was accomplished until last year, when many old claims were relocated, and, up to the present time, new discoveries have been made that have astonished even the owners of the oldest and richest claims, who originally have purchased from \$100 to \$500 per foot.

It is the impression, as you are aware, with many men that a claim is not worth buying unless it is held at large figures. But men of capital here have given the lie to this presumption by immense investments here. Here is located the justly celebrated Daney mine,

If I owned but a few feet in it a competence would be insured to me. They have a fine mill now running. Its erection cost them \$60,000; in three weeks running thereafter they cleaned up the neat sum of \$63,000—a paying investment that, was it not? That gave an impetus to mining operations, and a multitude of tunnels were run. Many have struck it very rich, with rock paying from \$50 to \$300 per ton.

### THE JEWELL COMPANY.

And here I may mention the Jewell Company, located near the Daney, and promising to be equally if not more valuable. In many things it possesses superior advantages over the latter company. Last week a committee from the Board of Trustees of the Jewell Company visited their mine. I had the pleasure of an introduction to these gentlemen, and with them visited their location. They have purchased a mill site from Mr. Seares, of Carson, City, and have advertised for bids to erect a fifteen stamp mill thereon. They have also let a contract for running their tunnel. The mill is to be like that of the Daney Company, which has proved to be an excellent one. This claim is on the Daney ledge, and prospects equally as well, if not better. One ton of the rock is to be shipped to your city in a few days for reduction and test. The proprietors of the Daney speak in the highest terms of their little neighbor, the Jewell, for it is a small company now, but bids fair to excel its larger companion. The rock already taken out is from a ninety foot shaft, and will pay over \$200 per ton. They have already commenced the tunnel so it shall strike the ledge two or three hundred feet deep. I believe the stock is all owned in San Francisco, except some seventy-five feet, and now held at from \$40 to \$50 per share. After an examination of this mine I am satisfied it is not one quarter its true value, and this I find is the opinion of its big neighbor, the Daney people. Old hands working on the Daney have been unable to tell Jewell rock from their own when placed side by side. The company have also located three hundred feet on each side, their tunnel covering several ledges

through which they have to pass. I speak thus explicitly of this company as they are to be considered next in reputation to the Daney, and because they show every evidence of the truth of what I tell you, and will, I believe, verify my words. I forgot to state that this proposed Jewell tunnel runs through the Tennessee ledge, which you remember my telling you was bought up by some parties who knew its value, for \$95,000.

The Hawley Co. deserve notice also; they are situated near the Jewell, and are daily rising in favor here. They have a fine engine on the ground, which they put there at a cost of \$7,000. There are others I propose to give you a statement of, such as the Mineral Hill, Chrystal Palace, Mount Hope, etc. Rest assured, however, that a few months will prove this district of which I have here written to contain some of the wealthiest mines in the Territory. We have a new town laid out, Geneva by name, distant about one and a half miles from Silver City and three from Dayton. Ten or fifteen houses are already erected, and more begun. However, for further statement, you must await my next, and meanwhile believe that I have made these notices of these claims from actual observation, and am confident that I have not even given you half as glowing an account of our mines here as they really deserve, or will prove themselves worthy of.

Yours Truly, L. D. S.

A silver lode has been discovered near Indian Diggings, El Dorado county.

Several copper companies at Fairplay, El Dorado county, are taking out ore for shipment.

The Virginia Enterprise is in favor of Washoe as a name for the Silver State. It is much better than that confounding, confusing, and unoriginal name of Nevada.

A brick-yard near Virginia has capacity to make 14,000 bricks daily. The price is \$17 per 1,000.

There is some talk about establishing a large private cemetery near Virginia.

#### COPPER DISCOVERIES IN CALIFORNIA.

Copper was discovered in the southern portion of this state very soon after the first influx of gold seekers to the Pacific Coast. Rich mines of this metal were found to exist at various points to the East of Fort Yuma, in Arizona Territory, and also to the North, along the Valley of the Colorado. Some attempts were made, at an early day, to work the mines in Arizona, but with little success in consequence of Indian troubles, the difficulties and expense of transportation and the high price of labor. We are not aware that any further attempts have been made, since that time, to work those mines. Recent intelligence from the Colorado, however, warrants the belief that the copper interest of that region will soon grow into considerable importance.

Copper was also discovered in Hope Valley, on the Eastern slope of the Sierra, not far from the Placerville and Carson Valley road, if our memory serves us correctly, as early as 1855. We have now in our possession a very rich specimen of "peacock ore," taken from the "Uncle Billy Rogers Lead," and placed in our hands in 1856. We are not aware that any considerable amount of work was done in this vein until the present year, when it was re-located, and regular mining operations commenced upon it, in a small way.

#### COPPER DISCOVERIES IN CALAVERAS COUNTY.

In the year 1855, Mr. J. W. Bean, of Copperopolis, who was residing some three miles north of the present Napoleon copper mine, picked up some specimens of what was no doubt carbonate of copper, from a ravine near his cabin. He took them home, and on showing them to his partner, was greeted with the remark that "they were nothing but copperas rocks, the country is full of the stuff, and it isn't worth a d—n." Mr. B. threw his specimens out of the door, among some rubbish, and by that act parted with indications, which, had they been followed up intelligently, would have led him to a fortune, and placed the State of California five years in advance where she now is in her great interest of copper mining. Early in 1860, Mr. Hiram Hughes, who had been for some years residing in the same neighborhood with Mr. Bean, was attacked with the "Washoe fever," and joined in the general rush, which took place in that direction in the Spring of 1860, as soon as he arrived in the neighborhood of Virginia City he was so struck with the great similarity of the appearance of the country there, with that where he had been so long living, along the foot hills of Calaveras county, that he made all possible haste back and commenced prospecting for silver. He soon located for silver and copper, what is now known as the first discovered copper mine in Calaveras county, situated on Quail Hill, No 1, about three miles north-east of the Napoleon mine, and some six or eight to the westward of Copperopolis.

We had intended to have visited this locality during our recent trip to Copperopolis, but want of time prevented. We hope to do so, however, at an early day. We understand that the locality is one of peculiar geological interest, quite dissimilar from the surrounding country, generally, and giv-

ing most unmistakable evidence of recent, intense plutonic action. Mr. Hughes is working his mine for gold and copper. The copper, we understand, lies in an intermediate strata, between two others which carry gold, with silver also to a considerable extent. The working for gold is carried on in the rainy season only, when water can be had for working—the free gold being thus taken out and the "tailings" carefully preserved for future reduction, by machinery. About 300 tons of copper have been taken from the mine and shipped, chiefly carbonates, which have assayed an average of 25 per cent.

Mr. Hughes was also the discoverer of the now famous Napoleon mine, eleven eighteenths of which he sold for the sum of \$22,000. We shall hereafter have occasion to speak more fully of this mine.

The discovery of copper on Quail Hill soon became noised abroad, and parties from this city went up to enquire into it. Prospectors were very soon out in various directions, hunting for "indications."

Early in the summer of 1860, Mr. R. B. Reed, having examined the ore at Hughes mine, started out on a prospecting trip, in an Easterly direction from Hughes'. While passing through a long narrow valley, about eight miles distant from his starting point—a locality with which he had been long acquainted—he observed some croppings, which on close inspection, he felt sure were of the same character as those on Quail Hill. He gathered up some specimens, and retraced his steps, about four miles, to McCarty's cabin, a well known stage stand on the Stockton road, where he submitted them to Dr. Blatchly, of this city, who had recently been attracted to that place by the fame of Hughes's discovery. The Doctor being something of a mineralogist, at once pronounced the specimens copper of most flattering indications.

Read, McCarty and Blatchly started out early next morning, and located and staked off for themselves and friends all the ground now embraced in the Union, Keystone, Consolidated, Empire and Calaveras claims—11,250 feet. A large number of sacks were filled with the croppings of carbonates, which were gathered from the surface. The first work was done by Dr. Blatchly, at what is now known as the Discovery shaft, upon the Keystone mine. The Doctor obtained good shipping ore at a depth of 25 feet. Mr. Reed soon afterwards commenced work upon what is now the Union Company's ground, and obtained good ore at about the same depth with the Doctor. The first ore shipped from this mine assayed, in this city, 30 per cent. It may be a matter of curious interest to some to state that the first work ever done on this mine was the sinking of a small prospect hole, three or four feet deep, by Mr. McCarty, somewhere about 1852. This small excavation may still be seen a few feet to the west of the Keystone Company's office. The opening was made in search of gold, but without success. The prospector however, has since been rewarded by a most ample fortune made out of the same ground, but from a mineral of another character. It may be recorded as a matter of some what unusual occurrence, that all the parties directly engaged in these early

and valuable discoveries held on their ground long enough to become independently rich. In our next issue we shall give some account of the progress which has been made in the development of these mines.

#### OUR MINING STOCK COMPANIES LIST.

We hope to be able to place before our readers, in our next issue, a full and corrected List of the Mining Stock Companies having offices in this city, and, to a large extent, located in other parts of the Pacific coast. We have already corrected a great number of errors in our last, and made many additions. We have devoted to this work almost the entire labor of three men during the past week, and we yet find much to do. A more general co-operation of Mining Secretaries, would greatly facilitate the work. While we cheerfully acknowledge the generous and willing aid of some, we regret to say that there are others who appear to take but little interest in a work which is of such evident importance to the entire mining community. We trust that all such, after our next issue, will realize the importance of the work, and hereafter lend a more willing hand in aid of our efforts in this direction.

Single copies of the issue containing the Directory, will be furnished gratis to all of our regular subscribers, and additional copies will be supplied to such at the regular subscription price. Twenty-five cents per copy will be required of non-subscribers, for that issue. Persons interested in the development of the mineral resources of California, can do much in aid of that work, by purchasing and forwarding to their correspondents, at the East the index of this recent mineral developments of the Pacific coast. The record shows an extent of operations and evidence of mineral wealth truly calculated to arrest and fix the attention of capitalists in the Eastern States and Europe. We shall send the proposed issue to the leading banker at the East and to all other prominent capitalists whose address may be at hand.

OUR "MINERS' LABORATORY."—In our articles on "Silver" in our "Miners' Laboratory," we do not purpose to confine ourselves to what are strictly called silver ores, but intend to place before our readers, all the minerals containing silver whether they are copper, arsenical nickel, cobalt, or antimonial ores.

It is also our purpose, after fully describing the ores, to place before our readers all the different processes employed in extracting the valuable metals, in various parts of the world, carefully and minutely detailed, and also, so far as we can arrive at them, all the Specifications of Patents, issued for such purposes in the United States and Europe.

THE Horn's Gold and Silver Mining Company, Mariposa county, are sinking three shafts on their vein, and at a depth of 28 feet are taking out decomposed quartz thickly studded with gold; together with arsenourated Sulphurets, very rich. The Messrs. Goddard & Co. have nearly completed a mill, for the company, of 20 stamps, with an engine of 50 horse-

power

## TABLE MOUNTAIN COPPER MINING COMPANY.

A large pile of sacks, containing copper ore, may be seen upon Montgomery Street, in front of No. 528, which has recently been received from the Table Mountain Copper Mining Company's Claim, located some three or four miles to the southward of Copperopolis. The claim was located about two years ago, since which time considerable work has been done, but with no important results, until about three weeks since, when a well defined lead of sulphurets was struck, narrow at the top, but gradually widening out, until it is now about two feet wide, with both walls well defined. Our correspondent considers this development one of the best outside of the Union claim. This claim, we believe, has generally been considered as on the same lead with the Keystone, Union, etc., and the appearance of the ore as seen upon Montgomery street, would seem to indicate that such is the fact—the general characteristics being similar and quite distinctly marked.

We understand that work is being prosecuted upon this claim with vigor, night and day shifts being employed. This, we believe, is the 5th claim in that locality which is now making regular shipments of ore, viz.: the Union, Keystone, Napoleon, Hughes and Table Mountain. The Calaveras Company has shipped considerable ore the past season, but operations on that mine have been suspended for the present.

Regular shipments will hereafter be made by the Table Mountain Company. That just received consisted of five tons, all taken from the main shaft, which is still going down. A drift is just being started, from which, and the shaft, the workmen will soon be able to take from three to five tons per day—increasing, gradually, from that amount, as the mine is more fully opened. The ore speaks for itself, and taken in connection with the above facts with regard to the mine, warrants us in pronouncing this one of the most important copper developments in that interesting region. The Company is incorporated, Mr. M. G. Elmore, at 528 Montgomery street, being its Secretary.

## VIRGINIA CITY.

The Editor of the "Spirit of the Times," in an editorial letter from "Silverland," speaks quite glowingly, yet truthfully, of the growth and prospects of Virginia City. We make the following extracts:—

The city of Virginia is the second city (in all those attributes which go to make up a great commercial and business emporium) on the Pacific Coast. \* \* \* Virginia has a growth of little over three years, and her record to-day is a history of itself. Her population is nearly double that of Sacramento; is double that of Portland, Oregon; is four times as great as that of Stockton or Marysville. Taking in the population of Gold Hill, which stands in the same position to Virginia that Mission Dolores does to San Francisco, and we have at least TWENTY THOUSAND inhabitants, and were the officers who take the census strict in the performance of their duty, I believe the number would be increased rather than diminished. \* \*

Last year the taxable property of Virginia was in the neighborhood of \$8,000,000—this year, the Tax Collector informs me, it will border close on to \$11,000,000, nearly double the amount. The assessment on this is \$2.72 on the \$100, of which thirty cents goes for school purposes, eighty cents for Territorial purposes, and the balance goes to meet the requirements of the county. This will give some little evidence of the wealth, rapid growth and stability of Virginia. \* \* \* The amount of business done in Virginia is positively immense and astonishing; it never ceases and seems to grow by what it feeds on. In extent, value and constancy, it is more like a city of ten times its age and population. It is remarkable in all the phases it presents, and is another high (!) and enduring monument to the energy and enterprise of the American people. The completion of the Central Railroad to this Territory will make Virginia a gigantic inland metropolis, and, independent of that which I have already seen, I believe that in five years from the present writing, by means of its own natural growth, it will be a city of forty or fifty thousand inhabitants.

The New York Post contains a list of 26 Banks organized under the National Banking law, with an aggregate capital of about \$3,500,000.

## CALIFORNIA COPPER SMELTING WORKS.

EDITOR MINING & SCIENTIFIC PRESS.—SIR:—In your number of the 21st. inst., you were kind enough to give a notice of the "California Copper Smelting Works." Your remarks are correct in the main, and I take pleasure in giving you the subjoined further details which may be interesting to your readers.

The following are the rates and terms on which the Company are now purchasing ores:

Ores assaying from 8 to 11 per cent. are purchased at the rate of \$2 per each per cent.

Ores assaying 12 per cent. at \$25.00 per ton.	
" " 13 " " " 27.25 " "	
" " 14 " " " 30.00 " "	
" " 15 " " " 32.50 " "	

A ton is received at 2,376 lb., to be delivered at the Company's works at Antioch. Shipments may be made in bags or in bulk. If in bags, they will be returned. The land and water freight will be advanced by the Company, on the delivery of ores at the works, and payment made as soon as a satisfactory assay shall have been obtained.

The California Smelting Works propose to buy their ores upon a different scale from that applied by other purchasers in this city. When ores are shipped East or to Europe, the net assay is taken, but from one to two per cent. is deducted and upon that produce the advance is made, and not upon the real per cent. as contained in the ore; but the California Smelting Company propose to buy upon the true amount in the ore. To illustrate:—From ore that will assay, say 14 per cent., any other parties here advancing, would deduct one and a quarter per cent. at least, and call it 12¾.

The Company will not confine itself to the purchase of ores of low assay. Contracts will be made for all the ores a mine may produce, and the higher the assay, the greater will be the price per cent.; but it is obviously to the advantage of copper miners to sell their inferior ores to the Smelting Works, since they cannot be profitably shipped to a foreign market; and the expense of concentration and the loss of metal attending on that process, will counterbalance any advantage obtained in economy of transportation, when concentrated.

Additional furnaces will be built, and due capacity of the works will be made to keep pace with the supply of ores.

Your obt. ser't.,

RALPH EMERSON,  
Secretary.

THE RECENT RICH "STRIKE" OF THE OPHIR COMPANY.—We learn from the Territorial *Enterprise*, through the Superintendent of the Ophir mine that since the discovery of the rich vein on the surface, back of the incline, some ten days ago, he has sacked and shipped to this city, about 5 tons of choice ore daily. The largest day's work was 15 tons. The most of the stuff thus far has been valued at \$2,500 a ton, but some of it went infinitely higher than that; another class will pay \$1,500; and still another \$3,000. Over 60 tons of it, altogether, have been shipped since the discovery of the vein. The lead was stripped still further yesterday, and hereafter the daily yield will be considerably over 5 tons. Within the past few days another vein has been found, some 20 feet further west, the ore from which assays \$405 per ton.

THE EBB TIDE.—The travel from and to the Washoe and adjacent country is becoming equalized. The flow back upon us is steadily increasing.

THE "CLAIMS" OF REESE RIVER.—According to the Reese River *Reville* of August 1st., there were, at that date, located and recorded in that mining district (Reese river) about 1,300 different company claims. Nearly half are separate ledged. Mount Hope has about 75 companies; Ravenswood, 85; Simpson's Park, 230; Big Creek, 350; Smoky, 300; Summit, 100; Sante Fe, 60; Grass Valley, 15; Union, 20; Cortez unknown.

AUSTRALIAN GOLD MINES.—The gold mines of Australia have been gradually declining for the past five or six years. Their average for the past twelve years is set down at \$41,000,000. These mines have gradually declined from their highest yield of about \$75,000,000 to a probable present yield of not far from \$25,000,000.

HUMBOLDT MINES.—The great riches of this mining district is well known, and little need be said of it. We have facts in abundance, to substantiate this, from persons of undoubted veracity. Yet there seems to be a strong tendency, among the miners and people generally to content themselves with prospecting and hunting up "big things," instead of proceeding vigorously with developments. This is an evil that must be overcome. The mills are said to be comparatively idle owing to this rush for new discoveries. A great lack of energy is apparent. People seem to be acting upon the impression that selling a silver mine is a more expeditious mode of acquiring wealth than working it, and accordingly the great anxiety seems to be to discover and "fix up" new leads for the San Francisco capitalists.

There is no question but scores of mines have been opened in that region, which will eventually be proven to be very rich. As it is, however, the hills and ravines are everywhere dotted with mere prospect holes, with here and there a few hundred pounds of rock brought to the surface, where, instead the beholder should see large piles of ore at the mouths of the tunnels and shafts, all ready for transportation to the mill. True, much of the ore found in this district cannot be worked by the ordinary silver process, still there is an abundance of ore there, or we are very erroneously informed, which can be worked—amply sufficient to afford the fullest employment of the idle mills which have been erected there.

If miners would advance their true interests, they should endeavor to develop their "feet," rather than to add, indefinitely, where thousands already exist.

The local papers and correspondents of that region all agree in the above representations of facts. Let the miners of Humboldt delve into their hills with tunnels and shafts, and they know how to do—let them bring to the light those minerals as they can do—let them haul it to their idle mills, and take out from the ore the gold and silver bricks as they should do, and, our word for it, they will soon place the Humboldt mines in the front rank of mining localities on the Pacific Coast. By so doing they will not only greatly advance their own interests, but add immensely to the productive wealth of the coast. A hundred feet fairly developed are worth the sands unimproved. A thousand dollars spent in developing a good mine is worth many thousands, scattered over an entire district, with no developments to prove its value.

Much confusion is often created by the use of the terms right and left banks of the river. Scientific writers use the term in reference to the position of a person descending the river. This technical sense of the term is now well settled among geographical societies and scientific travelers. This has been found the only way to give it any definite meaning. Right turn and wind so that nothing definite can be made out to east, west, north and south banks. Travelers go up stream and back again so irregularly, that none can know which bank is on their right hand or left at any particular time, unless they tell us, every time they use the word, which way they are going.

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an analyzer of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, is not bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable recommendations, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

# MINING AND SCIENTIFIC PRESS.

We append the following list of companies, which are known to us by name only. The locations of office and names of the Secretaries are not known to us. We will add those names and place them in our regular mining list, whenever attained.

Lyon, g & S, Big Creek District.  
Lad, g & s, Smokey Valley district

## The Pacific Mineral Company

MAKE LIBERAL ADVANCES UPON THE ORES OF  
COPPER, SILVER, TIN, NICKEL, COBALT, ZINC,  
LEAD, AND SULPHURETS CONTAINING GOLD.  
Due account taken of all valuable metals combined  
with Silver and Copper Ores, and advances made there-  
for.  
Parties owning undeveloped mines and desiring capital  
to prospect the same will receive assistance, if, upon ex-  
amination, such leads are deemed sufficiently valuable  
to justify such expenditure.  
OFFICE, No. 1, OLD FELLOWS' HALL,  
je-t-1 Montgomery Street, San Francisco.

## To Mining Companies about to In- corporate.

JOHN ARMSTRONG,  
CONVEYANCER,  
610 Merchant Street,  
San Francisco.

Is Prepared to draw with Accuracy and Dispatch,  
Certificates of Incorporation—Trust Deeds,  
and all other Papers,  
necessary to the correct Incorporation of Mining Com-  
panies, on reasonable terms.

All letters of enquiry cheerfully and promptly an-  
swered. Address as above. Jy27

## REMOVAL

of the "MINING & SCIENTIFIC PRESS" OFFICE:—After the issue of our present number, we shall remove to the spacious rooms, Nos. 56 and 57 Government House, corner of Sansome and Washington Street.

## THE MINERS' LABORATORY.—NO. XIII.

## MINERALOGY OF SILVER.

Silver is found in a variety of forms and combinations. Our object, in the present chapter, will be to describe them.

Silver is found native, (i, e) nature supplies us with the metal in a metallic state, occasionally. It fuses before the blowpipe; is soluble in nitric acid. The addition of hydrochloric acid, or common salt, produces a copious, white, curdy precipitate, which turns black on exposure to the light.

Some varieties contain very small quantities of copper, antimony, and arsenic; others contain gold. The specific gravity of pure silver is 10.1 to 11.

Silver occurs in veins, rarely in beds; in crystalline slate-rocks, gneiss, mica slate, hornblende slate, granite, syenite, porphyry, with arsenic and various ores of silver. It is met with most abundantly in Peru, Mexico, and Chile, and we may now add also Nevada Territory and California.

An amalgam of silver, with the following composition, has also been found in several places:—

Silver,	25.00	27.50	36.00
Mercury,	73.30	72.50	64.00

Silver also occurs in combination with Tellurium. Other metals are also present, as will be seen by the analysis given below. The scientific name of this mineral is *sybanite*. Specific gravity from 7.99 to 8.33; lustre, metallic; steel gray, tin white, silver white, some times inclining to brass yellow, streak the same. When heated before the blowpipe on charcoal it imparts a greenish-blue color to the flame, deposits a white sublimate on the charcoal, and melts into a dark gray bead. If heated with soda it yields a globule of an alloy of gold and silver; dissolve in nitric acid, with the exception of the gold, if silver be in sufficient excess; yielding a white precipitate with hydrochloric acid.

## ANALYSIS.

Silver,	10.00	11.47	11.31
Lead,	—	0.25	2.75
Copper,	—	0.76	—
Tellurium,	60.00	59.97	58.81
Antimony,	—	0.58	0.66

*Peterite*, Lustre Metallic. Between lead-gray and steel-gray; streak the same; slightly malleable; specific gravity 8.31 to 8.83. When heated before the blowpipe on charcoal, it volatilizes, leaving a brittle globule of silver, soluble in hot nitric acid; after standing some time the solution deposits crystals of telluride of oxide of silver.

## ANALYSIS OF THE MINERAL.

	1	2	3	4
Silver,	62.42	62.32	61.55	46.76
Gold,	—	—	0.69	18.26
Tellurium,	36.96	36.89	37.76	34.78
Iron,	0.24	0.50	trace	trace
Lead and Sulphur,	—	—	—	—

Occurs in granular masses, with iron and copper pyrites and blende in talc slate in two or three mines only.

*Antimonial Silver*. Lustre metallic silver white, inclining to tin white, streak the same, sectile, specific gravity, 9.4 to 9.8; melts easily when heated before the blowpipe, emits fumes, and deposits a sublimate of oxide of antimony on the charcoal, leaving a malleable globule of silver, partially soluble in nitric acid, leaving a residue of oxide of antimony undissolved.

## ANALYSIS OF ANTIMONIAL SILVER.

	1	2	3	4
Silver,	75.25	78.00	77.00	76.00
Antimony,	24.25	22.00	23.00	24.00

Occurs in veins in granite, porphyry, and crystalline slate rocks accompanied by silver, arsenic, arsenical pyrites, galena.

*Ruby Silver*—*Seleniuret of Silver and Copper*. Crystalline, lustre metallic, lead-grey, streak shining, soft. When heated before the blowpipe, emits the smell of Selenium, or a smell resembling horse-radish.

## ANALYSIS.

Silver,	38.93
Copper,	23.05
Selenium,	26.00
Earthy matter,	8.90

This ore was found in cleavable grains in a copper mine, now forsaken.

Other varieties of Seleniurets containing silver, are met with, but they are not of much importance, and we shall not describe them.

*Galena*, that is sulphide of lead, contains silver as sulphide, amounting usually to .01 and .03 per cent. occasionally to .05 and rarely to 1 per cent.

*Sulphurets of Silver*. Lustre metallic, blackish lead-grey, streak shining, malleable, specific gravity 2.96. Before the blowpipe on charcoal intumesces, melts with disengagement of a gas, called sulphurous acid, giving off the odour of burning sulphur, and at last yields a globule of silver, soluble with the exception of sulphur in concentrated nitric acid.

## ANALYSIS.

Silver,	86.50	86.39
Sulphur,	13.50	13.61

*Stromeyrite*.—Sulphuret of silver and copper, lustre metallic, blackish lead-gray, streak the same, shining, perfectly sectile, specific gravity 6.25

Before the blowpipe it fuses readily into a gray metallic globule, which with fluxes affords the reaction of copper, and by cupellation, yields a globule of silver. Partially soluble in nitric acid, leaving sulphur undissolved.

## ANALYSIS OF ORES FROM CHILE.

Copper,	30.48	30.95	53.38	53.94	60.58	63.98
Silver,	52.27	52.71	28.79	24.04	16.58	12.08
Iron,	0.33	0.24	—	2.09	2.31	2.53
Sulphur,	15.78	15.92	17.83	19.93	20.53	21.41

Form in crystals, usually massive and disseminated.

*Copper Glance or Vitreous Copper*, such as is obtained in Plumas County, California; and Colorado. We have also seen samples of the same kind of ore from Washoe, containing variable proportions of silver from a trace to 1 per cent. Samples of this kind of ore from Chile have assayed as high as 2.96 per cent. in silver.

To detect the presence of silver in such ores, proceed as follow: Dissolve the finely pulverized sample in pure nitric acid. Evaporate the largest portion of the acid by continual boiling, dilute with water, filter, and to the filtrate add hydrochloric acid, and a white precipitate will indicate the presence of silver in the rock.

*Jamesonite*; lustre metallic, steel-gray, streak the same, sectile, specific gravity 5.564 to 5.616

Decrepitates when heated. Before the blowpipe it melts easily, deposits a sublimate of oxides of lead and antimony on the charcoal, and after, lead and antimony are driven off, leaves a slay which usually affords the reactions of copper and iron.

## ANALYSIS OF JAMESONITE.

Lead,	39.67
Iron,	2.93
Copper,	1.73
Zinc,	0.34
Silver,	1.44
Bismuth,	0.21
Antimony,	32.17
Sulphur,	18.07

MR. EDITOR:—The remarks of "A Poor Chemist" on my communication to your journal of the 3d. inst., on the tests for silver, are anything but what one would expect from a gentleman professing to be acquainted with chemical reactions. The errors that crept into my communication by inadvertence, owing to the fact that your proof reader was not well versed in chemical tests, were sufficiently evident to the merest tyro in chemistry. Allow me to inform "A Poor Chemist" that I am thoroughly acquainted with the test for chlorine. I deny, though, the assertion of "A poor Chemist" that Sulphide of Ammonium and Chromate of Potash are not commonly used as reagents to prove the presence of silver. Can he point out to me any author on practical chemistry who has neglected these tests? Would he consider an article on tests for silver complete without the above tests? especially when we take into consideration that it is your object to lay before the readers of your valuable journal, from time to time, a list of tests for all the metals.

"A Poor Chemist" also says that some statements, however, of the properties of Hydrochloric acid seem to imply absence elsewhere. I shall feel thankful to "A Poor Chemist" for pointing out to me and your readers, where I have erred in describing the properties of Hydrochloric acid when applied as a test for silver.

## DRY CRUSHING.

It is now a generally conceded fact that by the wet method of crushing quartz a large proportion of the gold is carried off from the batteries and away from the mill in the first rush of the water, employed to discharge the sands through the sieves. Gold is capable of such minute divisions, and is so easily separated that all must concede that in the violent abrasion to which it is subjected in the battery, its particles, as they occur in the quartz, must necessarily lose much of their weight by parting with numerous atoms so infinitesimally small, that the slightest current of water must inevitably carry them off.

We will illustrate, again, as we have already done in a previous number:—A piece of gold, especially if it be pure, drawn across, even so soft a substance as a piece of bone, leaves a well defined yellow mark. This mark, of course, is made of particles of gold which have been abraded by the contact of the two substances. It is often the case that gold is found through the entire mass of rock, in particles no larger than those which form this graphitic-like mark. Such, no doubt, is the character of the gold found at the Mission near this city. A moment's reflection, with this little experiment in mind, can scarcely fail to astonish any quartz miner, who has never had his attention particularly called to the matter before, at the large percentage of loss which must occur in a battery where many thousands of particles of intermingled gold are, for hour and days, subjected to the terrible abrasion of eight hundred pound stamps continually falling upon a mass of angular fragments of hard quartz. Of course, a large percentage of the gold mingled with quartz, must be reduced to particles quite as minute as those contained in the supposed yellow mark upon the bone above alluded to, all of which must inevitably be carried off by the water necessarily passing through the battery during the process of *wet crushing*. Indeed, this finely divided gold will float upon the surface of the water for a month, even when it is slightly agitated, without becoming wet on its upper surfaces, and, of course, without sinking.

Another great loss from wet crushing arises from the fact that no sieves can be made available with holes sufficiently fine to retain the quartz in the battery until it is reduced to a proper fineness for liberating all the gold which it contains. Hundreds of distinct particles of gold may be contained in a piece of quartz no larger than a pin's head, a large portion of which might be separated and saved by proper machinery, but never by any machinery where wet crushing is employed.

The facts above stated have, for years, been gradually impressing themselves upon our quartz operators, until the losses, sustained by the processes at present in use have come to be looked upon as a matter for the most serious investigation. Dry crushing, in the first instance, is the only conceivable remedy, for the losses alluded to. Of the various processes for amalgamating, there are several in use which might be advantageously employed. Of these we may speak, at length, in a future issue. The matter at present under review is crushing—wet and dry.

As already intimated the evidences of the losses from wet crushing, have long challenged the attention of quartz men and various expedients have been resorted to to render practical some process of dry crushing. The ordinary straight and round batteries have been tried with sieves boxed up to prevent the dust from rising. A very ingenious machine for dry crushing, was introduced to notice, in this city, last winter, and illustrated in this journal, known as "Pond's Crusher." We have also given an extended notice of Howell's Centrifugal Crusher, which has been quite thoroughly tested at the Pike's Peak Mines, but the latest improvement in the way of dry crushing, is a machine recently got up and patented, by Messrs. Wheeler & Hotelling, and which may now be seen in operation at the Miners' Foundry in this city.

This latter machine is the one alluded to in our last issue, which we will now attempt to describe as well as it may be done without illustrations:—

This machine, in the first place, comprises an ordinary battery—without sieves, boxed up closely. In the rear of the battery, and some some six feet distant, is a large chamber some ten feet square. Two or more tubes or pipes start from the upper, interior space, within the battery, and unite

tion the outside, as near as may be to the same, and extend to the lower portion of the chamber adjoined. About midway of this tube, is a small chamber in which is placed an exhaust fan, which, when in operation produces a strong exhaust current of air from the interior of the battery to the interior of the chamber. As a matter of course the quartz, as fast as it is thoroughly pulverized, rises, in the form of dust, is drawn through the tube and deposited in the chamber in the rear. The fineness of the dust is regulated entirely by the force of the exhaust draft, which may be easily regulated by a sliding tube or the speed of the fan. Its current is kept up and aided by a return flue, of much larger dimensions, from the top of the chamber to the lower portion of the battery—the return flue taking the air from a point in the chamber, as far removed as possible from the point where the dust is received from the battery. Actual working shows that very little is returned to the battery by a return current of air.

This machine is but an experiment, yet a most flattering one thus far. We are not yet able to determine the quantity of work which it will perform. Of course the wear and tear can be no more than that of an ordinary battery. Our impression, from what we have seen, is that the battery now in use—four stamps of 500 lbs. each—can reduce about 30 tons of rock, delivered to the battery dry, in twelve hours. The rock delivered from the machine is reduced to fine dust, exhibiting but a mere grit, when tried between the fingers, dry. We have, at our office, a sample of the dust which we took up at the mill, from a large mass, as a sample of the whole.

Important improvements are already in contemplation. The experiment is in the hands of parties who have had considerable experience in quartz mining, and who will spare no efforts in bringing it to perfection. Quartz miners and others interested will do well to examine and judge for themselves. The machinery has been at work upon rock from the quartz mines back of the Mission in this city.

#### THE MINING SHARE MARKET.

The Mining Share Market has presented nothing of special interest during the past week. It has been characterized by rather more than a fair degree of activity and with about the usual fluctuations. The transactions may be set down as large, though generally at reduced rates. Advanced rates, however, are noted in several shares. Gould & Curry, early in the week, declined \$250 on time, but subsequently advanced a shade, closing firm at \$4,725, for reason so far as we have been able to learn, has been assigned for the recent decline in this stock. The yield of the mine continues without abatement, and larger dividends are confidently expected after the present month, or as soon as the additional works now in progress have been completed. The late sales have been made by parties who have heretofore refused the highest offers.

Ophir shares opened at \$2,450, advanced \$75 on time, but closed at \$2,350, with sellers at 2400. The recent "rich strike" in this mine is still reported as continuous, with no appearance of "giving out"—anything but the richest kind of ore valued at from \$1,000 to \$3,000 per ton. If there is any approximation to truth in the reported richness of this rock, it is difficult to conceive why the Company should not increase their dividends, at an early day, to a higher figure than by which it has yet reached.

Potosi shares are held firmly at an advance of \$100. We quote at \$825. It is said that a fierce contest will be made by the Grass Valley Company for a title to this valuable mine, and that every preparation has been made by them to strengthen their application for an injunction against the Potosi. The argument is to be heard by Judge Mott during the present week.

Grass Valley stock, under the influence of the above proceedings, is in request at about \$95.

Chollar shares, which had advanced, the previous week to \$1,150 @ 1,500, have not been so much sought after, the past week, and have declined to \$1,300. The affairs of this Company, at the present time, are under a most prosperous condition, such as can scarcely fail to advance its shares, at an early day, beyond any figure which they have yet reached. It is stated that sixty tons of ore are now daily taken out of the north end of the mine, which is sold

at an average of \$30 per ton. The company's new 100 horse power engine for hoisting, pumping, etc., will be used 400 feet south of the present workings; the shaft at this point has penetrated to the depth of 285 feet.

Hale & Norcross has not been in the market the past week. Its stock is held by parties who are not anxious to part with it, at present offers.

Central and California shares have not been much dealt in.

White & Murphy, Dick Sides and Best & Belcher, are withheld at present. "No transactions" are reported in these shares. Judge Mott has granted an injunction against the the Kohinoor Company, at the instance of the Best & Belcher.

Spanish No. 2, adjoining the Mexican and Ophir on the North-East. According to the Prices Current of the 13th inst., this mine "is attracting some attention." After two years of patient labor and the expenditure of a large amount

of money by this company, it is said that a continuation of the "white lead" of the Ophir and Mexican has been developed, and that abundant pay metal is now in sight. This stock has been dealt in, the past week, at great fluctuations, opening at \$75, and closing at \$35.

Buckeye has been quite active, in fact has been the fancy of the week. Sales of 553 shares are reported at \$38 @ \$62½. It opened the week at \$55, advanced to \$60, at which figure some large sales were made. Buyers were induced to invest upon the report of a favorable financial condition of the company, with cash in hand, a large amount of pay ore on the surface and a new vein "just opened," containing "black sulphurets, very rich." The speculators having accomplished their purpose, the shares fell back to their old standard and closed the week at \$38.

The Sacramento and Meredith Companies having consolidated their interests, will hereafter be known as the "Sacramento & Meredith Mining Co." The latest quotations of these shares are \$115 for the former, and \$70 for the latter. No sales of the consolidated stock have been reported.

Overman is still growing in favor. Its shares have been considerably dealt in during the week, fluctuating from \$380 to \$500, closing at \$390.

Wide West has been largely dealt in, at declining rates. These shares opened the week at \$165 and gradually fell to \$145 @ \$147 at the close—sellers \$150.

Real del Monte shares have attracted marked attention. Closing the previous week at \$275; they opened the past at \$300, advanced to \$435 and closed at \$415. Sales of 130 shares are reported.

Esmeralda is dull at \$22, Silver Hill at \$30 @ 33, Ural firm at \$150.

Coso has declined to \$11, Josephine advanced to \$13½, and Willow Springs is quoted at \$14½.

Sheba shares have changed hands to a limited extent extent at from \$222 @ \$225. De Soto had advanced to \$70, after having sold for \$48.

#### COPPER.

We have no report of transactions in copper stocks for the past week. Intelligence from the mines, however, is still of the most gratifying nature. Almost daily reports are reaching us in the shape of large quantities of well filled sacks of the most promising ore.

The Table Mountain Copper Co., near Copperopolis, has made its first report of this description, which may be seen in front of the Secretary's office, on Montgomery street and which is elsewhere alluded to more at length.

The Union, Keystone and Napoleon still continue their regular shipments. Small shipments are also beginning to come in from several new sections of the copper belt, which are received as the earnest of larger ones soon to follow.

Considerable attention is being attracted to the copper mines upon the Colorado. Some very superior ore has recently been received from that section.

PICK MANUFACTORY.—We would call the attention of miners to the advertisement of Mr. HIRAM WHITE, which will be found in our columns to-day, who has recently established himself, on Bush street in this city, for the manufacture of Picks for miners use. Mr. Wright makes a very superior article and miners or others engaged in the trade will do well to call upon him.

#### REPORT OF BIDS

At the San Francisco Mining Stock Board,  
For the week ending Aug 16, 1883.

Names of Companies.	Total No. Shares.	Shares per lot.	Par Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.

#### SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

OLD PICTURES copied with care and accuracy, in any style desired. Particular attention paid to pictures of Children.

Pictures painted in Oil or Water Colors, and retouched in Indian Ink by a competent artist.  
Jc22 R. H. CORNELL.

## BAUNCHEIDTISM,

THE PRESERVER AND PRODUCER OF LIFE.

THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF curing disease, is a "fait accompli" in medicine, and needs no more proof. The public has crowned Bauncheidtism already with an extraordinary patronage, and it is acknowledged by all men of science that BAUNCHEIDTISM is founded on a rational, scientific basis. It can be safely, and with sure success be applied to paralysis in consequence of Apoplexy, Podagra and Rheumatism of every description, which kind of complaints can find their only relief by the above method. Especially can it be applied successfully, in the spring of the year to diseases of the eye.

Dr. Borchers is the only doctor in California who has the original series of Dr. BAUCHEIDT and his original oil. Dr. Borchers is also in possession of original letters of the inventor of the method by which he can prove that he is perfect master of the latter.  
DR. J. C. BORCHERS.

No. 19 Kearney street, and No. 4, Mark's Place, First story, No. 5. Office hours from 9 to 11 A. M., and 1 to 4, and 7 to 9 P. M. Jc21

## THE BRYAN BATTERY.

The vast interest involved in the reduction of area on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

### METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any place of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1840, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.

A. B. FORBES, Agent.

Je4 Corner of Sacramento and Leidesdorff sts.

## WHEELER'S

### Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to flow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

These Pans have been in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
2c16-tf ZENAS WHEELER.

**50 lbs. MARINE and  
Fire-Proof Paint,**

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Bales and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire-Proof, and costing less than any paint.

**DIRECTIONS:**

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

VEGETABLES,

Of Messrs. CHOLLET & CO., PARIS, which he offers now for sale in lots to suit.

These Vegetables being perfectly fresh and sweet, are the best preventive of scurvy and other diseases resulting from the continued use of salt provisions.

They are already cleaned and prepared for cooking are perfectly preserved, and offer great advantages for transportation. 25,000 rations being packed in the space of one square yard, while 2,000 rations—or equal to 1,000 lbs fresh vegetables—weigh only from 100 to 125 pounds.

No. 216 Front street,

**Offices To Let,**

In the Government House, Corner of  
Washington and Sansome Streets. Two large suits of  
Offices, the most commodious and accessible in the city.  
C. A. CRANE, Proprietor

**Eye, Ear and Throat.****DR. DE CASTRO,**

Oculist and Aurist,

**WHO HAS PRACTISED IN NEW**

York and all the principal cities of Europe, with such unrivalled success, and from each place is in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. Deafness of long standing thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**Self-adjusting Artificial Tympanum,**

For the relief of deafness, attended by loss or injury of the membrana tympani, and for the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state; the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

32. Mr. Editor—Having been afflicted with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent one operation, and it is with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist.

JOHN REESE, Napa Valley.

James Callaghan, witness,

San Francisco, July 30th, 1863.

[From the Daily Alta.]

San Francisco, June 30th., 1863.

ED'S DAILY ALTA:

Permit me through your widely circulated journal, to say that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearny and Market Streets, and undergoing under his direction, two operations, she has heard sounds very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill, and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skilful physicians and aurists in California, but up to the period of visiting Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT,  
812 Green Street.

**MINING CERTIFICATE LOST!**

Certificate for Ten Shares, No. 23, dated July 8th., 1863, of Tamplius Gold and Silver Mining Company. The finder will be suitably rewarded by leaving it at room 24, Government Block.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI. SAN FRANCISCO, THURSDAY EVENING, AUGUST 27, 1863. NO. 43.

## LIST OF INCORPORATED MINING COMPANIES,

GIVING THE NAMES OF THE COMPANIES, NAMES OF SECRETARIES, LOCALITIES OF MINES AND OFFICES.

We present our readers, to-day, with a Supplementary Edition of eight pages containing a revised list of Incorporated Mining Companies. This list contains the names of over *One thousand Companies*, with their Secretaries, location, etc. In addition to these we give the names of upwards of *three hundred* other companies, the names of whose secretaries and other data, we have not yet been able to obtain. We shall issue another edition of the Directory in about a month from this time, which we are desirous to make as full, complete and perfect as possible. Any changes which may be made in the mean time, if handed in, will be corrected in that issue, and any additions made.

The work, we are doing, is an entirely gratuitous one. The Directory is furnished to subscribers without extra charge, as a supplement to our regular edition. We have made several hundred additions to our last issue, and a great number of corrections. All must admit the importance and convenience of such a publication. In fact it has become quite a necessity. The Secretary of every Mining Company owes it, as a duty to his Companies and to the public, to see that all the Companies which he represents have a place in this Directory. Whenever a change is made in the location of the office or the name of a Secretary, the fact should be promptly communicated to this office, so that it may appear corrected in the next issue. Such attentions will save a great amount of labor on the part of individual stockholders who may have business at the offices of the various Companies.

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, AUGUST 24, 1863. NO. 43.

## REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing in re room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

## OUR PROPOSED ENLARGEMENT.

The rapid increase of business both in the enlargement of our circulation, and in additions to our advertising patrons, such as we hope will soon enable us to announce a permanent enlargement of the paper. For the present we propose to issue an extra sheet every other week. We shall continue this arrangement until our business, which we must will continue to improve, will warrant a permanent enlargement, when the two issues will be thrown into one sheet and the paper established as a sixteen page issue.

## OUR MINING REGISTER

The supplementary issue of the present week, will consist mainly of a revised edition of our Mining Register which will be delivered free to all subscribers. Extra copies will be furnished to subscribers at the regular subscription price—Non-subscribers will be taxed twenty-five cents. will be issued to-morrow—Tuesday.

**COPPERPOLIS.**—We continue, in our present issue, the publication of notes taken during a late trip to Copperopolis. This region is being rapidly developed by the energy of its miners, aided largely by San Francisco capital. We spent several days in Copperopolis, but not half time enough to become thoroughly acquainted with its value and extent as a mining region. We shall endeavor to place before our readers such facts as we were able to collect, promising ourselves another visit at an early day, for more extended observation. We also hope at that time, to extend our trip into Amador, and still other portions of Calaveras county. In our next issue we shall speak at length of the Keystone, Union and Calaveras Companies Mines, and also of the Napoleon. We enjoyed our trip thither, much, and would take this opportunity to tender thanks for favors and courtesies received—especially to the Messrs. Powning, to Mr. J. W. Can, the gentlemanly clerk of the Copperopolis Hotel, and Mr. W. T. S. Ryer.

**RAILROAD IN NEVADA TERRITORY.**—The Virginia City and Truckee Railroad Company has been fully organized and a survey of the road completed, and grading is to commence immediately. The road runs from Virginia to Washoe City, a distance of thirty miles. A branch of four miles debouches and touches Carson City. The estimated cost of equipping and construction, is \$2,583,069 56.

The Pennsylvania Coal Mines Considered in Connection with the Recent Northern Invasion of Gen. Lee.

There is little doubt but that the destruction of the Pennsylvania Coal Mines was a portion of the rebel programme as marked out by them on the recent invasion of Lee. Had the confederate forces succeeded in occupying Harrisburg, the railroad communications between that point and the mines, about 50 miles distant, would have been destroyed, also all the pumping, hoisting and other machinery necessary for working them. It is not at all improbable that he would also have set the mines on fire, as he might easily have done, thus literally kindling a flame in the heart of Pennsylvania, which could never have been quenched except by turning rivers of water upon the conflagration!

The damage not only to the great industrial, but also to the commercial and military interests of the country which would have resulted from such proceedings can scarcely be estimated. All other raids which have been consummated by either or both belligerents, would, in their aggregate even, have fallen short of the tremendous blow which the destruction of the Pennsylvania Coal Mines, would have inflicted on the North. Northern industry would have been completely paralyzed by this single blow.

Anthracite coal is found in large quantities in no other part of the world but Pennsylvania. Enormous quantities of this description of coal are used for making steam in the countless workshops and manufactories of the North, and on their river and ocean steamers; while the Federal navy, as at present organized, would be almost powerless without it. The bituminous coals which are found in other localities, are far inferior to the anthracites for making steam, while the cost of transportation of such coals to the Atlantic coast would be enormous. The Richmond *Whig* of July 2nd was quite jubilant over the prospect which then existed that this terrible blow would fall upon us. It was happily averted by the terrible battles of July 1st, 2nd and 3d, and the government has evidently become aware of the great strategic importance of Harrisburg, and energetic measures are in progress for securing its safety against any future contingency.

**IMPROVED WATER PIPES.**—Wrought-iron water-pipes, lined and coated with hydraulic cement mortar, which are great improvements on other substitutes for cast-iron pipes, are now, at the East, rapidly superseding the former exclusive use of iron, under conditions of expense, oxidation, tuberculation, and leakage, which involve serious objections in water-works practice. These pipes have spigot-joints, can be back-filled as soon as laid, and tapped in the same manner as cast-iron pipes. Cement lined and coated water-pipes are now in use in a large number of our northern cities and villages, and have proved very satisfactory in operation.

**STATE AGRICULTURAL SOCIETY.**—The Tenth Annual Fair of the State Agricultural Society will commence on the 25th of September. Ten thousand dollars have been appropriated for premiums.

MR. EDITOR:—You will bear me witness that it was only at the last moment before your going to press a fortnight ago that I penned the few lines which appeared in your number of that date. They were intended to prevent any of your readers from purchasing sulphate of ammonia or chlorate of potash instead of sulphide of ammonium and chromate of potash, which those of them who relied only on "P's" communication would have been likely to do. With the errors that he says "*crept in by inadvertence*," left uncorrected and therefore by implication confirmed, "*miners*," not "*tyros in chemistry*," might otherwise have wasted their money and their time. "P's" rejoinder in your paper of last week gives much more importance to the subject. I found the letter in "*THE MINERS' LABORATORY*." "P" now classes it with the works of "*author's on practical chemistry*." Does he really wish to imply that he considers his "*list of reagents for silver complete*?" It contains but six. Rosé enumerates 19. I think, therefore, that I had a right to assume that the six were selected for their aptitude for occasional use, away from the resources of a fixed laboratory. I spoke of two of them as not commonly used. What is the fact? Alas, they do not furnish distinctive tests, when employed with solutions which may contain other metals than silver. The chromate of potash is classed by the above well known authority among the least used reagents. Can "P." buy one pound of the pure salt in San Francisco, in a day? The sulphide of ammonium is one of the most perishable articles we use. The air contained in a half filled bottle will destroy its purity. Fownes, Lamborn and Muspratt omit one or both. I have referred to books in my reply to the enquiries of "P," but I will venture to say that "P" in his practice, when traveling or prospecting, would never encumber himself with so superfluous an article. Why does "P" sneer at me in reference to chlorine? I wrote chloride. Need I tell him that I meant chloride of potassium, or chloride of calcium, which occur according to the mode employed in the manufacture of the chlorate of potash.

"P" might have been "absent," I thought, but he has returned to his task, and he is still of opinion, he says, that "*a solution of hydrochloric acid*" added to the "*contents of a bottle*," will "*precipitate (silver,) antimony and bismuth*." His first letter stated the color of the precipitate, viz: "*white*." I cannot doubt therefore that he has seen it. Allow me to congratulate him on his discovery; but why did he not announce it as such? He added that "*a quarter of an ounce of hydrochloric acid*" (I suppose the ordinary solution in water) would dissolve the antimony and bismuth, in a few moments. Your readers are therefore in this dilemma, either hydrochloric acid will both dissolve and precipitate these substances, or "P" has omitted to state the important ingredient in his "*solution of hydrochloric acid*," which precipitates antimony and bismuth and makes them rapidly dissolve again. "P" opened with supposing that "*the solution*" of pure silver was made in nitric acid. He directs no change to be made in this solvent. It will be a farther addition to science, if he will state explicitly how he can dissolve antimony in that acid. It will enlighten many

A POOR CHEMIST.

## COPPEROPOLIS AND ITS MINES.

In our last issue we gave some account of the early discoveries of copper in Copperopolis and its vicinity. A short time after regular work was commenced upon the mine, (early in the Fall of 1860,) Mr. Reed, one of the discoverers, being satisfied that the same would be permanent, put up a cloth house under the big oak tree still standing in front of the Copperopolis Hotel. This was the first house of any kind, built in Copperopolis. It was used as a boarding house for the hands employed upon the Keystone mine. The next house built was a small wooden building, still standing on its original location, a few feet distant from the first, and now used as the Justice Court Room. This was also built by Mr. Reed, and used as a boarding house for the hands employed upon the Union mine. Other structures, of wood and cloth, soon began to grow up around these pioneer buildings.

Early the following Spring, (1861,) Mr. J. M. Bean, fully satisfied from the developments already made that a town of considerable size must speedily grow up in that locality, commenced the erection of what is now known as the Copperopolis Hotel, one of the largest structures in that region of country. The commencement of this edifice led to quite an excitement, and a general staking out of lots, was immediately commenced. From that time to the present, Copperopolis has been rapidly increasing in growth and importance, until it now numbers a population of fully 1200 souls, with three hotels and several restaurants, two livery stables, two barber shops, six or eight well filled stores besides numerous smaller establishments, where "creature comforts," etc., are dealt out. A school house has been erected and a lot of ground set aside for a cemetery. Religious worship is held in a public hall.

Copperopolis presents at the present time, all the peculiar characteristics of one of the early mining camps of 1850, with the exception that its houses are constructed of lumber rather than canvas, as in those days. We know of no mountain town which bids fair to enjoy a more prosperous or permanent future than this young city of copper. It possesses mines of undeveloped extent, and of the most undoubted richness and permanency. Its future increase must reasonably keep pace with the development of its mines, which, thus far present indications excelled nowhere else in California.

## THE MINES OF COPPEROPOLIS AND VICINITY.

The traveler in approaching the foot hills from Stockton, on the Copperopolis road, if at all observant, will notice soon after leaving the plain a most marked change in the character of the country, which is not observable at any point north, along this range of hills, for at least a distance of one hundred miles. The change here alluded to is one, chiefly of a plutonic character, although the sedimentary rocks have at intervals been disturbed by protruding masses of the older crystalline formations, the latter also much changed by heat.—This belt of country is from four to five miles wide, from east to west. Its linear extent, north and south, we had no time or opportunity to observe, but from reports of persons familiar with the country, we infer it to be three or four times its width, at least. We apprehend that but few continuous veins of minerals will found be in this belt. The veins, wherever found, will doubtless be rich, in chimneys; or if continuous will be subject to numerous faults, or dislocations, which will entail much expense, in working, to keep the course of the vein.

After leaving this belt, in traveling eastward, the observer will notice quite as marked a change as on entering it. Its eastern limit is clearly marked by a well defined belt of slate, "tilted" as the commonly received opinion is, into an almost perpendicular position, with its sharp, rough edges sticking out of the ground from a mere perceptible outcrop to several feet in height. We have very little faith in this "tilting" process, in most instances, and in this, in particular; but of that at some future time. How far eastward this belt extends, we know not, for we explored no further in that direction than the town of Copperopolis. Along the linear extent of this slate belt, conforming in dip and direction with it, is what is evidently the mother vein of the district, and upon which are located, commencing at the northern extremity, the Consolidated, the Keystone, the Union, the Empire, and the Calaveras, which are adjoining claims, and through each of which there are unmistakable evidences of a continuous vein.

The character of the enclosing rock, and the surrounding

country generally is such as would lead the miner to look there for a continuous vein, without faults, and of a generally superior character. There are no indications of any local disturbances which might be supposed to produce "faults" or any special or extensive inequalities in the yield of the veins.

This vein may be looked upon as the "Comstock" of the copper region. There are numerous other veins, outside of this, some of which have already been found valuable, and others, yet undeveloped, show most flattering indications. Among these latter we might mention prominently the Eureka and Elizabeth, Consolidated, situated on the Eastern slope of Bear mountain. This vein, located about three miles to the east of Copperopolis, shows most unmistakable indications of richness. The Company have sunk a shaft of fifty feet, from which they are now taking out ore. This vein was originally taken up for silver. It assayed from \$4 @ \$7 per ton in gold and \$5 @ \$20 in silver. Nuggets of native silver were taken from ravines crossing this vein some five or six years ago. The ore is a sulphuret of copper, with the usual show of carbonates on the surface. The Company, which is composed mainly of San Francisco men, intend pushing on the work of development with the utmost vigor. The mine is under the superintendency of Mr. Solomon Johnson. Among the extensions of this lead we notice particularly the Crockett. This Company has taken out some 20 tons of ore.—fine yellow sulphurets.

The Table Mountain Company, is generally supposed to be a continuation of this lead, although many think it upon the Union and Keystone lead. Its position would seem to indicate the correctness of the first conclusion, but its general characteristics resemble more those of the Keystone than the Eureka.

Swinging around to the southward and eastward, about four miles from Copperopolis, we came to the Webster and Scorpion Company's claims, continuations most likely of the Union. The former has already shipped some fifty tons of ores to the smelting works of Antioch. They have sunk a shaft 130 feet deep on a well defined lode, six feet wide all the way down. The ore near the bottom of the shaft averages about seven or eight per cent., but is now improving with the decent. The Scorpion Company's claim is an extension and has also a very fine lode, yielding a higher grade of ore at corresponding depths. Considerable prospecting has been done upon this claim, but no large amount of ore has yet been raised from the mine.

To the south of Copperopolis, some four miles distant is the Swansey and Massachusetts Company's claims. The former has a shaft on their lode 70 feet deep, developing ore similar to the Webster and Scorpion. At that depth the shaft leaves the lode and has gone down thirty feet further, from the bottom of which the workmen are now drifting to the lead, with the expectation of finding richer ore than at any point opened above. The Massachusetts is a new claim and an extension, presenting flattering prospects. The surface indications are better, if anything, than even the Swansey.

To the west of Copperopolis, and in a valley lying parallel with that in which the town is located, there are a number of mines opened, with flattering indications. At the time of our visit, no work was being done upon any except the the Harlem and the Powning. upon the former, a large amount of work had been done under the direction of Mr. Westby the discoverer and Superintendent. Mr. W. showed us one of the finest shafts which we have ever seen in any locality, which had been commenced, but abandoned for the time. It is contemplated to put this shaft down, at some future time, to strike the vein at a great depth. At present he is taking out rock from near the surface, from another shaft. The ore from this mine is of a very promising character, considering the depth which has been reached. It resembles the Napoleon ore more nearly than any other which we noticed in that locality. Passing on, up the valley, we stopped for a few moments at the Kentucky company's shaft, near which we found some very good ore. A short distance from this point is located the Powning claim, a new location presenting very rich croppings. At the time of our visit the workmen had found no very distinct vein, but had arrived at indications which gave promise of soon arriving at a good lead. There are quite a number of other leads in this locality from which we shall probably hear favorable accounts ere long.

Some two or three miles above this locality a new town has been laid out, under the somewhat high sounding title of Carmen City. At the present time it consists of some three or four houses, only, but from the appearance of numerous specimens of copper ore which were shown us as having been taken from the mines of that neighborhood, we should not be surprised to see quite a town there in another year. The miners of Carmen City will have to go to work and do something to develop their mines, however, before they will be able to attract much capital thither. Copper indications have become quite to common at the present time to attract much attention from moneyed men, until some reasonable amount of labor has been done towards their development. It is not every vein that produces a few specimens that will turn out a good mine. Mines must be proved to have certain specific indications before they can be called *mines* or possess a value in "feet." Miners of every class will do well to bear this fact in mind and act accordingly.

## PROGRESS OF THE PACIFIC RAILROAD.

Steadily and surely onward is progressing the work of the great trans-mountain railroad, which as the Western division of the continental road, is destined, ere long, to unite the Atlantic and Pacific coasts, with indissoluble bands of iron, cemented by a common interest and a united destiny. The first division of 50 miles from Sacramento is already under contract, and the second division of the same extent which reaches to within six miles of the summit, will also be under contract by the first of December next. The route decided on is *via* Auburn, Illinoistown, Dutch Flat and Hell's Pass.

Work has already been commenced and is going bravely on. Slowly but steadily and surely, the iron feet are tramping up the Western Slope, and ere another twelve months shall elapse the locomotive's whistle will echo along its lower hills and valleys. Three years can scarcely come and go ere the iron horse will mount its highest level, pause a time, upon its giddy height, then resume its onward course across the hills of Silverland, along the valleys of the Great Basin, ar bounding over the slight obstructions of the once dreaded Rocky Mountains, continue its career far over the distant Plains beyond, and down the magnificent valley of the Platte until it reaches the turbid waters of the Missouri, where, unless the energies of our people are greatly overrated, it will arrive in season to celebrate the return of our next nation decade.

Six miles of the first section of the Western terminus the road are now ready for the rails, and six miles more will be ready during the present month. Six thousand tons of iron have been purchased, the delivery of which will soon commence at the rate of 500 tons per month. A large portion of this amount is now on its way from the East. Six locomotives, six passenger cars, twenty-five freight cars and twelve baggage cars are now on their way hither, as also are the tables for the first fifty miles of the road.

YIELD OF LAKE SUPERIOR MINES.—The Houghton Mining Gazette, of July 4th, gives the following as the yield of three principal Copper Mines of Lake Superior for the month of May last:—

The Quincy is again entitled to the flag for the largest product of any mine in three Districts for the month of May. The following are the figures:—

Quincy.....	129 tons, 313 lbs
Cliff.....	126 " 615 "
Minnesota.....	88 " 1,737 "

The above mines have been fairly opened, and under energetic progress for about eighteen years. California will present three, certainly, and we think we could name five if six copper mines, which will make a better exhibit of yield inside of twelve months from this date.

PROSPECTING FOR SILVER.—We learn that a party of capitalists in this city have associated for the purpose of examining mining claims in the neighborhood of Colima, one of the richest silver districts in Mexico. A man of scientific attainments has been employed and sent forward to prospect the claims in view carefully and thoroughly. Intelligence of his arrival at Manzanillo has been received, and his return is looked for in the course of next month. Should he report favorably, a considerable amount of capital will be once embarked in the enterprise.

## A NEW IDEA AND A GOOD ONE.

The Esmeralda Times, in speaking of the progress of the work upon the Stanford Tunnel in Aurora, notices the following ingenious expedient for furnishing light for the workmen during the day time:—

The tunnel, the most of the day, is worked without using candles. Mr. L. L. Deming, the Financial Secretary of the Company and Acting Superintendent, has found a more economical light; he uses the sun to work by. The tunnel is so admirably situated, and the cut being so wide, that it enables him, by the use of a mirror, to reflect the full rays of the sun quite in to the end where the men are at work, and it is so light that a paper can be read as easily as on the outside.

The above tunnel is in about 150 feet, with a open cut at its entrance, quite large in extent and height. Miners in other localities, driving tunnels, will do well to profit by this hint. The light introduced as above, is not only free of cost, but must be infinitely better than that derived from candles.

THERE IS TALK of establishing a Stock Board at Carson City, N. T. The local paper predicts success, should one be established. Why not?

ELECTRIC LIGHT IN PARIS.—The lighting of this, it is stated, is to be intrusted to M. J. in Malderan, who has invented a new electric light, one jet of which is equal to 2,200 lbs of gas. The Place Saint Sulpice is destined to be the first where the essay is to be tried.

QUICK WORK.—A letter from West Point states, as a sample of the efficacy of the graduating class of cadets that they dismount a cannon, and separate the parts of the carriage, and re-erect them, and fire the gun in 26 seconds.

GOLD QUARTZ SUITE FOR CUTTING JEWEL

By FRONTIER AGENCY,

18 ap

437 Pine street, San Francisco.

## San Francisco Machine

...AND...

## IRON WORKS!

Northeast corner Fremont and Mission Streets.

ALL KINDS OF MACHINERY MADE TO ORDER ON most reasonable terms. Steam Engines, High and Low Pressure; Quartz Mills, Saw Mills, Mining Pumps, Hoisting machines for mining purposes, Water Presses, Agricultural implements etc., etc., and Castings of all descriptions made to order. Steam Engines exchanged and for sale by

J. H. KNOX, DUNSMORE &amp; CO.

REPAIRING promptly attended to.

FOR SALE.

One Upright Post Drill, Putnam's manufacture, All one thirty inch screw Chuck, San Francisco, July, 1883. Jc13

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in crushing up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans have been in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. Jc16-tf ZENAS WHEELER.

## Miners' Foundry

—AND—

## MACHINE WORKS,

First St., between Howard &amp; Folsom,

SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the Best and Most Economical, manufactured in the state of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

\* \* \* Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere

HOWLAND, ANGEL &amp; KING

San Francisco, February 23, 1883.

## 50 lbs. MARINE and

## Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Lead and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

## DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

## 25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

## DIRECTIONS:

HOUSE.—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. Fouquet, Superintendent.  
WORKS, North Beach; Office, 509 Sacramento st., San Francisco.

## The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

## Mining and Scientific Press Agency

The most desirable place to make application for Letters Patent on the Pacific coast. Apply at

Office of the "Mining and Scientific Press," Room No. 27, Federal Building, corner of Battery and Washington streets, (directly opposite the Post Office,) San Francisco. EWER & SMITH.

## FOREIGN PATENTS OBTAINED

By application at this office, Room 27, Federal Building EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 27, Federal Building. Terms moderate. EWER & SMITH.

## PATENT RIGHTS.

Patent Rights Bought and Sold, At the office of the "Mining and Scientific Press" Agency EWER & SMITH.

## IMPORTANT TO INVENTORS.

Inventors who obtain their Patent through this Office can have their inventions illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns free of charge. The free use of our columns to us, and then in introducing their inventions to the public will be found a most important advantage to inventors. EWER & SMITH.

## MINING &amp; SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1882. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patents with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers.—Four Dollars per annum

Six Months, \$2.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of twenty and over, the yearly subscription is only \$2.00. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

## THE COPPER INTEREST OF CALIFORNIA.

Notwithstanding the great attention which is now being attracted to the copper interest of this State, we apprehend that but a very imperfect idea of its actual present extent and importance is entertained by even well informed observers. Indeed, in the existing lack of statistical information, it is difficult for readers to inform themselves upon this point. The flush of excitement which a few months since pervaded the public mind has, in a measure, passed away and given place to active and persistent labor in developing the mines, and in bringing to the surface and shipping to a market the most valuable portion of the ores. Work enough of this description has been done to establish, beyond a doubt, a high value for quite a number of mines, and to afford reliable data for important calculations and estimates with regard to the future of this new branch of our mining industry.

It is now less than a year since W. K. Reed, the discoverer of the Union mine, in Copperopolis, sold six shares, or 975 feet, of that mine to the house of Meador, Lolor & Co., of this city, for the sum of \$65,000. The developments of the mine, since that sale have been such as to place its present actual value at fully \$1,200 per foot or \$1,140,000 for the interest sold by Reed. We have no idea that even the smallest interest could be purchased in this mine at the advanced rate above named. Probably \$1,500 would be a low estimate of the actual value of this mine per foot. We understand that no assessment was ever laid upon the Union Company's ground. Not even Washoe, with its famous Comstock lode of silver can make a better showing, in time and results.

Shipments of copper ore from this port to New York and Boston since the first of January last, inclusive of the cargo of the Mary L. Sutton, which sails, to-day, cannot be less than 4600 tons, with an aggregate value of full half a million of dollars. This is independent of no inconsiderable quantity which has gone forward to Europe on foreign account. The ore thus shipped, it should be borne in mind, is only a small portion of that which has been raised. As for instance, the Keystone mine has shipped, in all, from its first opening, about 1200 tons. In getting out this amount, they have also raised at least 10,000 tons, which still lies at the mouth of their mine, as second class ore, which, when concentrated by the machinery now being erected, will make about 4000 additional tons of shipping ore as good as the average of that which has gone forward. The Union Company has about 15000 tons of second class ore upon the surface, which is considerably richer than the Keystone, and which will probably yield, by concentration, about 7000 tons of fair shipping ore. These are the results of two mines only, obtained within about two years.

There are now some ten or twelve mines regularly shipping ore to this city, most of them in small quantities. It is true, but all pushing on the work of development with an energy which gives promise of a rapid increase and an early magnitude of the copper interest, fully commensurate with the highest degree of importance which has yet attached to it. In addition to these there are hundreds of others which have been discovered, a large proportion of which will undoubtedly be developed into paying mines.

It has been feared by many that the great increase of the copper yield foreshadowed by the wonderful discoveries in this State, will so effect the value of that metal as to bring it below the standard of a paying business. There need be no fears of that. Copper has been regularly advancing in price for many years. Even the Lake Superior mines, although they have nearly doubled the yield of that metal have not even checked the advance in its price.

It is, or should be, a well known fact that the Copper mines of Cornwall are giving out—that is, their yield is changing from copper to tin. Many of the once productive mines of Cornwall are now worked for tin only, the copper having gradually run into that metal, as the depth of the mine has increased. Chili, another great source of supply, is also decreasing its yield, with a fair prospect of an almost total cessation thereof. The fact is, the discovery of some new copper field had become almost a commercial necessity, when a fortunate accident turned the attention of California miners in that direction.

It appears to be one of the laws of an Overruling Providence that in all the great interests of human industry the supply is made to keep pace with the demand. The discovery of coal, the application of steam, and the invention of

gun powder are noticable instances of this great law. The discovery of new deposits of the precious metals had become almost a necessity to the increasing commercial wants of mankind, when the new gold fields of California were opened up. So of silver in Washoe, and copper, of a later date is no exception to this general rule. In support of the position we have taken with regard to the copper yield, we give the following from a recent number of the London Mining Journal:

"It appears from all information that can be obtained that the demand for metals is greatly on the increase, and must increase as nation after nation see the necessity of adopting liberal tariffs. The Copper Mining Interest has suffered more than any other branch of mining enterprise during the last two years. A wide spread rumour was circulated, some months ago, that the stock of copper in England was much greater than for many years past; but such is not the fact. The stock at the present time is, actually, much below what it has been for several years, and the returns from the mines, generally, greatly on the decline. At least twenty of the greatest mines in Cornwall, during the last forty years, may be said to be almost exhausted—for copper, and some of them are now ranked as tin mines, only. Several of the mines in Chili are reported to be nearly exhausted or have ceased to be of any commercial value, as they were surface deposits, principally, and the copper not found in regular veins or lodes as in this country; but mere carbonaceous blocks of copper on the surface. Foreign mines will not pay, as a rule, at a standard under £140 (\$700.) No doubt legitimate speculations in copper mines, at present, are some of the safest investments the public can embark their spare capital in."

**NEW QUARTZ MILL.**—Mr. John Center of the Mission Gardens, is putting up a Quartz Mill capable of reducing about 12 tons of rock per day, on Center Street, near the Mission Bridge. This Mill is being erected for experimental purposes. It is a crushing mill, on the principle of that now employed for similar purposes at the foot of Market St. The crushers will be graduated so as to bring the rock to the required fineness by a succession of rollers, after leaving which it will be subjected to the action of an improved Chili mill process. The amalgamating machinery will also be constructed on a new principle. We shall give a particular and probably illustrated description of this mill and machinery, when completed.

**THE HEPBURN & PIERSON PAN** is a new amalgamating pan which has recently been introduced into use at Virginia City, and which is highly spoken of. The *Esmeralda Star* says that it is about being put up in Gregory's mill, at Aurora. The *Star* further attests to three separate trials of this pan with as many others of different construction, in which the Hepburn & Pierson pan each time excelled its competitors. We have no knowledge of the merits of the pan, and know nothing of the principle upon which it operates. If the proprietors have a good machine, they will find it to their advantage to have its merits properly placed before the public. Illustrations are given in this paper, free of cost, where the parties furnish their own plates.

**PACIFIC BOARD OF BROKERS.**—A Board of Brokers, under the above title, was organized in this city on Tuesday, August 18, 1863. The following gentlemen were elected officers of the Board: James Hitchens, President; Wm. P. Denckla, Vice-President; Jas. H. Gager, Secretary; T. D. Mathewson, Treasurer; Chas. H. Watson, Sergeant-at-Arms. The Board meet daily at 12 M., for business, in the new rooms of Thos. Maguire, No. 606 Washington street, near Montgomery.

**FROM THE COLORADO.**—The *Los Angeles Star* says: Capt. Johnson, who arrived this week from the Colorado, brings with him specimens of ore, the richest yet exhibited here. Out of a piece of rock weighing two and a quarter pounds he obtained fourteen ounces of metal, copper and silver. For the want of proper implements he lost probably one-third of the metal. There are thousands of tons of such mineral on the surface: and it extends for leagues.

**CHEAP TRAVELING.**—A New York journalist says he made a trip from New York to Europe, paid for his passage and everything he had, journeyed over the continent and passed four months, for four hundred dollars.

## GAS AS A MOTIVE POWER.

The Paris "Scientific Press" gives a lengthy description of a new motive engine recently invented by M. Hugon, of that city, together with a philosophical explanation of the principles on which its action is founded. The article is quite too long to be transferred to our columns.

The idea of the application of gas as a motive power was first conceived about the year 1853. From that time to the present much ingenuity has been devoted to reducing it to some practical result. Models of the various improvements have been preserved, so that the curious in such matters can easily trace the gradual development of the idea, and identify the various stages of the discovery. The machine now presented by M. Hugon is described as being correct in principle and eminently practical in use.

## DESCRIPTION OF THE GAS ENGINE.

The generator, which corresponds with the boiler of steam-engines is a curved tube, in the form of the letter U; the summit of the smaller arm bears the valves of escape and of introduction, and the larger arm is provided with clacks, which remain closed by their own weight. The clacks open in the bottom of an upper reservoir. In a certain part (which is variable) of the great arm of the U tube is placed a welling, which serves to connect the tube with the cylinder. This is similar to the cylinder of a steam-engine, with this exception, that it bears two openings for the introduction and two for the escape, of the liquid. Over these orifices are placed four slides, two of them being in communication with the vacuum tube, and two with a basin in which the water driven from the tubes can be evacuated, the water being firstly poured out in the reservoir which surmounts the large arm of the U, and then passed into the bin by an over-flow pipe. The piston communicates the motion to a first-motion shaft, upon which are geared the different machines for giving movement to the pumps, blowers, of air or of gas, as well as to the different slides of the tube or cylinder.

These generators or tubes, above described, may be increased indefinitely, as it may be desirable to increase the power and so connected as to transmit to common cylinder the vacuum produced.

To cause the machine to work, it is necessary to fill with water the U tubes, the reservoir up to the overflow-pipe, the swellings that put the second branches the two generators in communication with the cylinder, the cylinder itself and the basin, up to a certain point. When the various organs of the machine are filled with water, a certain quantity of the explosive mixture is introduced into the valves at the top of the first generator, whose ignition determined by the electrical spark, or by an incandescent platinum wire, or by a gas-jet. The dilatation of the gases, tried immediately to a very high temperature, drives a certain portion of the water of the generator with great force through the clacks of the great branch, into the higher reservoir, which, in turn, allows it to flow into the great basin.

The valves are then opened and the piston is advanced by the motion of the slides. The consequence of the vacuum upon one face, and on the other by the water exposed to the atmospheric pressure, a force equal to the difference of the pressures exercise the two sides, or, to speak more plainly, with a force equal to that of the vacuum produced.

The piston, in advancing, causes the water which is upon the face directed toward the vacuum to replace a certain portion of that which has been driven out of the generator by the combination of gases. When it arrives at the end of its stroke the movement of the slides is reversed.

The above description if fully read, will convey some idea of the principle of a new and ingenious machine, which, may yet become an important instrument in advancing the great industrial and commercial interests of the world.

The speed of rotation the machine will depend upon the number of the generators, and the dimensions and forms of the openings for introduction and the escape of the water of the cylinder does not produce, in working, any vibration, or shock of kind; the heating of the water of circulation, after day's work, never exceeds 133°

Fahr.; and the consumption of gas is about 53 or 56 cubic feet per horse-power per hour.

The English *Journal of Gas Lighting*, from which we collate the above, promises further particulars with regard to experimental results, which we shall transfer to our columns whenever they come to hand.

#### RIGHTS OF WOMEN TO HOLD MINING CLAIMS

A correspondent of the *Virginia City Union* informs that a journal that some "smart individual" in the Monitor District is trying to secure mining ground and make his fortune by re-locating, in that district, all the claims that have been recorded in the names of women. The correspondent is also desirous of learning what rights women have for holding mining ground. The Editor of the *Union* correctly informs his correspondent that in law, husband and wife are one person, therefore no man can, by using the name of his wife in locating, hold two claims upon the same ledge. Of course this would not prevent him from locating a claim for his mother, sister, cousin, or any female in the world whose husband was not a locator on the same ledge, nor would it be any bar to the husband or wife acquiring, by purchase, an interest in the same ledge in which the other owns by location.

Plain as is the above proposition with regard to the unity in law, of man and wife, it is, nevertheless, not an uncommon thing, in many localities, for the name of the man and wife to appear as locators on the same ledge. Of course such titles are invalid. It is feared that much litigation is in store with regards to titles so held and conveyed. Much valuable mining ground in this State, has recently changed hands at high rates where the original title comes from locations made by man and wife upon the same ledge. Capitalists will do well to look closely after the character of their titles. There is a degree of looseness manifested with regard to mining titles that is seen nowhere else. There is no reason why the same circumspection should not be employed in searching into the validity of a mining title, that is always employed in looking after a purchase in real estate.

#### SILVER CITY, N. T., MINING NEWS.

**THE LADY ELLEN.**—The Lady Ellen Company's mine is situated in Silver City, near the spot where the roads to Carson and Dayton branch. Work upon this claim, which is one of the most promising in Silver City, is progressing energetically. The company are hard at work upon two shafts, sinking night and day, and have continued to take out pay rock from the surface down. They are now shipping rock to the regular mills which will pay about \$60 a ton.

**THE CHAMPION.**—The Champion is one of the best claims in Silver City. It is worked through a tunnel some two hundred feet in length; the ledge ranges from four to seven feet in width, and the rock pays about sixty to seventy dollars a ton. The crushing is done at Gears' mill in Carson.

**THE PIONEER CLAIM.**—Very rich rock was recently struck in the Pioneer Company's claim, Silver City. This claim, as its name imports, was among the earliest taken up in the Territory.

**THE CARSON CLAIM,** in Blue Sulphur Spring District, has recently turned out some fine looking ore.

**STATE OF WASHOE.**—Provided the people of Nevada Territory vote "Constitution, yes" on the 2nd day of September next, the delegates elected will assemble at Carson City, on the first Tuesday in November to frame a State Constitution.

**PIKE'S PEAK.**—The *Denver News* says matters are looking up in Colorado Territory. In some localities miners are realizing from \$10 to \$30 per diem to the hand. Georgia, American, Galena, Delaware, Gold Run and French Gulches, are said to be paying immensely. Everybody has plenty of money, and such prosperous times were never known before in those diggings.

The Pacific Mineral Company are shipping, the present week, to England, ores of copper, gold and silver. This shipment is made per ship "Orpheus."

The Pearl fishery in Ceylon the past year has realized over a million dollars.

#### THE MINING SHARE MARKET.

The excitement in the Mining Share Market heretofore, of late, noticed has somewhat subsided. Operations for the week past, though embracing quite a wide range of stocks, have been, with a few noticeable exceptions, rather at declining rates.

Ophir has advanced to \$2,500, on thirty days; Gould & Curry remains firm at \$4,750 (at \$4,800). A few August dividends have been sold for \$147 by irresolute holders. The more prominent holders of both Ophir and Gould & Curry, manifest quite an indifference to their market value, having full faith in the mine as a permanent dividend paying institution.

Chollar, early in the week, declined to \$900, but soon recovered to \$1,200 and closed at \$1,100, with small sales.

Potosi has advanced \$125 and is quoted at the round figure of \$1,000, with a firm market.

Sierra Nevada has been a favorite of the week. We quote at \$105—a material advance. Shares to the number of 422 have changed hands at rates ranging from \$87½ @ \$106.

Daney has been largely dealt in; 597 shares having changed hands at fluctuating rates, ranging from \$105 @ \$150.

Buckeye still continues the fancy of the market. It opened the week at \$40, a small advance, soon reached \$48, and finally closed at \$37½, a shade lower than the figure with which it closed the week previous. Several hundred shares of this stock are reported among the sales of the week.

North America, at Gold Hill, has been considerably in favor, 418 shares having changed hands—fluctuating from \$50 @ \$67.

Overman shares are still growing in favor. Opening with \$390, the closing bid of the previous week, they steadily advanced to \$495; and at the close \$510 was bid without finding sellers.

Burning Moscow, not much dealt in; dull at \$85. North Potosi, at \$40; Lucerne, at \$25; Lady Bryan, \$12½; Meredith, \$80; Burnside, \$5; El Dorado, closed at \$70; Sacramento, \$80; Madison, \$20; Bullion, G. H., 69; Pride of the West, \$95; Grass Valley, \$60.

North America, Gold Hill, has been much in favor, fluctuating from \$50 to \$67, with a large business.

ESMERALDA shares have not been largely dealt in. This district still seems to rest under a cloud, but the enterprise of its mining population, in their resolute efforts to develop their mines must soon bring it out brighter than ever. Strangers visiting that locality, are invariably surprised at the representations of the bears and other interested parties, in this city, with regard to the value of the mines. The camp is evidently deficient in effective mills, yet the average of the rock crushed there is fully equal, if not in excess, in point of yield to that crushed in Virginia City. The mines here are in fact just beginning to be developed, and it is safe to predict that another year will bring about results in this locality that will astonish even the most sanguine.

Wide West has been very little sold; dull \$145; Esmeralda, \$25; Bamboo, \$30; Pond, \$37½; Falls of Clyde, \$5; Ural, \$162½.

Josephine, Coso District, has been considerably dealt in.

#### COPPER.

The Copper interest still continues to attract a large share of attention. The regular arrival of ore from the interior; the gradual increase in yield of the older mines and the continual addition of new ones to the catalogue of those producing ore, considered in connection with the increasing aggregate of shipments East, to domestic and foreign ports, is giving a degree of importance to this growing interest which cannot fail to arrest the attention of our moneyed men. The "Mary L. Sutter" sails to-day, with about 600 tons of ore from the Napoleon, Union, Copper Hill and Alta mines. The The Pacific Mineral Company are also shipping, this week, per the "Osprey," to England, both copper ores of gold and silver. Active prospecting operations are still in progressing throughout the entire copper region, and quite a number of mines in addition to those already shipping, will soon commence sending their ores to market. The Wilson Copper mine, some six miles above Lincoln, is now putting up a twenty-horse power engine for hoisting and pumping, and will commence shipping ores as soon as their machinery gets to work.

#### REPORT OF BIDS

At the San Francisco Mining Stock Board,

For the week ending Aug. 22, 1883.

#### SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

**CAUTION.**—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

## ESMERALDA MINING ITEMS

**THE UNIONVILLE TUNNEL CO.**, which commenced work in February last are pushing ahead vigorously. The *Star* says that this tunnel is not surpassed in workmanship by any other tunnel in the district. It is now in a distance of 375 feet. They have already struck four well defined ledges; the first of which will pay for working; the last one however which has been struck at a depth of 275 feet is a rich one in which free gold can be plainly seen. It is expected that this enterprise will bring to its owners a rich reward. It pierces the richest portion of Last Chance Hill.

**THE LAWTON LEDGE**, on Silver Hill has a shaft down to the depth of twenty-five feet. They have a lode about four feet wide.

**THE STANFORD TUNNEL** is now in about 150 feet. The latest indications were that they were in close proximity to a ledge. The workmen are now taking out rock of a bluish, green color, of a character which often lies contiguous to a silver bearing vein, and which almost invariably contains chloride of silver. This tunnel is bound to be one of the best paying enterprises in the district, its location is particularly advantageous, being at right angles with all the rich ledges on this side of the hill.

**THE ENTERPRISE TUNNEL** is about six hundred feet in length and running into Last Chance Hill. Very recently they struck a ledge seven feet wide. The rock shows sufficiently to justify—as some of the holders think—a raise in the stock.

The *Times* says the **CLAN ALPINE** company has a lot of rock at the Brodie mill and will soon know by actual practical illustration what it will pay.

**THE KORAN LEDGE** on Last Chance Hill is having a prospecting shaft sunk.

**THE CORTAZ CONSOLIDATION CO.**, on Silver Hill are sinking a prospecting shaft.

**RICH.**—Twenty-one tons of ore from the Aurora lode, one of the ledges belonging to the Real del Monte Consolidation, yielded at a late crushing \$4,347, being \$207 to the ton. The ore was not assorted. There is no danger that a mining district turning our large quantities of such ore as this, will ever fail to sustain itself.

**THE UNION FOUNDRY** in process of erection at Aurora by Mr. Geo. W. Coffee, is nearly completed. The *Times* speaks most flatteringly of the completeness of this institution, and justly calculates on large advantages to be derived therefrom for that camp.

## The Pacific Mineral Company

**MAKE LIBERAL ADVANCES UPON THE ORES OF COPPER, SILVER, TIN, NICKEL, COBALT, ZINC, LEAD, AND SULPHURETS CONTAINING GOLD.** Due account taken of all valuable metals combined with Silver and Copper Ores, and advances made therefor.

Parties owning undeveloped mines and desiring capital to prospect the same will receive assistance, if, upon examination, such leads are deemed sufficiently valuable to justify such expenditure.

OFFICE, No. 1, OLD FELLOWS' HALL,  
1st-1st Montgomery Street, San Francisco.

## BAUNCHEIDTISM,

THE PRESERVER AND PRODUCER OF LIFE.

THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF curing disease, is a "fait accompli" in medicine, and needs no more proof. The public has crowned Baunceidism already with an extraordinary patronage, and it is acknowledged by all men of science that BAUNCHEIDTISM is founded on a rational, scientific basis.

It can safely, and with sure success be applied to paralysis in consequence of Apoplexy, Palsy and Rheumatism of every description, which kind of complaints can find their only relief by the above method.

Especially can it be applied successfully, in the spring of the year to disease of the eye.

Dr. Borchers is the only doctor in California who has the original series of Dr. BAUNCHEIDT and his original oil. Dr. Borchers is also in possession of original letters of the inventor of the method by which he can prove that he is perfect master of the latter.

DR. J. C. BORCHERS.

No. 19 Kearney street, and No. 4, Mark's Place, First story, No. 5. Office hours from 9 to 11 A. M., and 1 to 4, and 7 to 9 P. M. je 21

## THE

## BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

### METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the Improvements which the experience of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent. more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed is cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.

## VIRGINIA CITY MINING ITEMS.

The BEST & BELCHER Co., recently purchased and paid \$10,000 for a private residence which they found in the way of working their ground. The improvement will be moved off. None but a rich company can afford to pay such prices for the removal of incumbrances.

The Stock Books of the Buena Vista Company having been destroyed by the fire which consumed the Pioneer Foundry. The Company will re-unite their stock in lithograph.

An assay of rock from the Athens ledge, near Carson, showed \$3,550 in gold and \$11 50 in silver. The company are within fifty or sixty feet of the ledge with their tunnel, and will strike it about 100 feet below the surface.

STRUCK IT.—The laborers in the Golden Gate shaft have struck water, at a depth of three hundred and twenty-nine feet. The Company will commence drifting west immediately. The Golden Wedge Company, which, in connection with the Golden Gate Company, sunk the shaft, will commence drifting east.

These Vegetables being perfectly fresh and sweet, are the best preventive of scurvy and other diseases result-  
ing from the continued use of salt provisions.  
They are already cleaned and prepared for cooking; are perfectly preserved, and offer great advantages for transportation. 25,000 rations being packed in the space of one square yard, while 2,000 rations—or equal to 1,000 lbs fresh vegetables—occupy only from 100 to 125 pounds.

C. A. CRANE, Proprietor

**Eye, Ear and Throat.**  
**DR. DE CASTRO,**  
Oculist and Aurist,

**WHO HAS PRACTISED IN NEW** York and all the principal cities of Europe with such unrivalled success, and from each place is in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. Dr. De Castro's long standing thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**Self-adjusting Artificial Tympanum,**  
For the relief of deafness, attended by loss or injury of the membrana tympani, and for the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state: the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

**Mr. Editor—Having been afflicted** with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent one operation, and it was with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist.  
JOHN REESE, Napa Valley.  
James Colloghan, witness.  
San Francisco, July 30th, 1863.

[From the Daily Alta.]  
San Francisco, June 30th, 1863.

**ED'S DAILY ALTA:**  
Permit me through your widely circulated journal, to say, that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearny and Market Streets, and undergoing under his direction, two operations, she has heard sounds very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physicians and aurists in California, but up to the period of visiting Dr. De Castro, received no benefit.  
CHAS JOHN P. WRIGHT,  
812 Green Street.

**MINING CERTIFICATE LOST!**

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, AUGUST 31. 1863. NO. 44.

## REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

## ON FLUXES.

This subject is one which has been brought before the public of San Francisco, this week, by several of our contemporaries, and one flux which has been variously described, as "a silicate of cadmium," a silicate of manganese," and a silicious deposit containing animalculæ," has been considerably lauded for copper—Roasting, or something else in addition, or as a preliminary, being omitted, or not, according to the judgment of the operator. Amid all the mystery this appears to contain, we have been shown copper, melted when this "flux" (?) has been used conjointly with another. We have also seen buttons of copper obtained where "previous knowledge of smelting" was employed, and where, therefore, something tangible besides this flux was probably put in the pot. These are the only authentic cases of success we have heard of. We know failures abound. One of the successful manipulators admits that it is not applicable for use in a cupola. In contrast with this, we cite from a recent paper by our rising chemist, Prof. Joy of New York, the following beautiful application of scientific knowledge to this subject.

In treating beryl, to obtain glucinum, "One part of beryl was fused with three parts of fluorid of potassium, and digested in sulphuric acid." He adds: "If this flux could, be obtained in sufficient quantity, the method would be preferable to all others, as the mass fuses easily, the fluorid of silicon is driven off at a gentle heat, and the potash alum crystallizes readily, carrying down all of the alumina, thus at the same time accomplishing the decomposition of the silicate and the separation of the alumina and glucina."

**GEOLOGICAL POSITION OF THE VEINS OF PRECIOUS METALS IN WASHOE AND REESE RIVER.**—The Reese River *Reveille* says:—The mines of Washoe are in syenite, porphyry, and other granite rocks. Reese River presents one series of mines in granite, as about Austin City; another in metamorphic shales, as in Smoky Valley and Big Creek. The Comet vein traverses slate. The heaviest masses of native metallic silver have been found in veins traversing shales; and, on the other hand, the large masses of chlorid of silver in South America have been the product of veins in metamorphic limestone. Oxid of silver is a rare ore, but is occasionally met with in Mexico and South America, and in the veins about Austin. It is mostly found in veins traversing granite."

[COMMUNICATED.]

Mr. Editor:—"A Poor Chemist" will find the properties of Hydrochloric acid when used in qualitative analysis fully described in tables prepared for laboratory use, by Dr. Hoffman of the Royal College of Chemistry, London. You may rest assured, Mr. Editor, that I will not mislead your numerous readers in describing to them the tests for metals. Did time permit me, I would answer "A Poor Chemist" more fully, and ere I complete these papers I may fall upon him again. P.

**FROM EL DORADO COUNTY.**—We have been shown some very good auriferous rock from the Baltic and Harman ledges of Placerville. The Baltic, at a depth of 25 feet, is producing rock which yields twenty-five dollars per ton.

The Hoffman at a depth of 75 feet is producing 35 dollars to the ton. It is believed that these ledges will rank second only to the New York mine, of that vicinity.

**THE NEWSOM Gold and Silver Mining Company** is located half a mile from Silver City, and is the north extension of the Buckeye. The Company have sunk a shaft on the ledge to a depth of seventy-five feet, and are taking out about two tons of pyrite rock per day. The ledge is six feet wide, steadily increasing in width and richness. There are now out about 40 tons of quartz which the Company intend to crushed at one of the adjoining mills, the proceeds to be used in developing the mine.

**SULPHUR.**—A large field of Sulphur has recently been discovered, near the Lassen Meadows on the Humboldt. It covers some sixty acres, from one to three feet thick, so far as explored, but it is thought that further explorations will develop its still further extent beneath the surface of the ground. This discovery is a very important one, to that district of country, as it will afford an abundant and cheap supply of the raw material to the sulphuric acid manufactory now about going into operation near Carson City. This factory, alone, will consume about one ton of sulphur each week. As the mines are opened up other factories will soon be required, and an enormous quantity of this material will be needed soon.

**NEW MINING SUITS IN WASHOE.**—The following mining suits were commenced in the District Court at Virginia City on the 19th and 22d inst:—Heiss vs. Woodruff et als., to recover thirty-seven and a half feet in the Belcher claim, Gold Hill. Patrick Keenan vs. H. Harris & Co., to recover the sum of fifteen hundred dollars. A. S. Olin vs. Samuel Welch—attachment suit. Joseph Barnett vs. J. H. Mallett, to obtain an injunction restraining a suit in the Civil Probate Court by defendant against plaintiff, for possession of a store on C street, adjoining Wells, Fargo & Co.'s. Potosi Gold and Silver Mining Company vs. Junction Gold and Silver Mining Company, to obtain an injunction restraining the Junction Company from working on ground claimed by the Potosi Company.

The oldest newspaper in the world is printed at Pekin, in China. It is upwards of 1000 years old.

## MATTERS IN ESMERALDA.

Correspondents from Esmeralda report large quantities of quartz lying around the mines, betokening large shipments of bullion during the approaching Fall and Winter. A lack of facilities for crushing keeps this treasure back for the present. A correspondent of August 2d writes:—

"The Del Monte has a large amount of quartz out, but is not working now. The Pond is in the same position. The Ural is hard at work, and has some 60 tons of ore at Gregory's mill to be crushed. From the kind on hand at the mine, the chances are that it will yield largely. The Western Summit has one of the finest opened mines I have seen; the rock looks fine, and the Company will have a crushing so soon as the Ural rock is worked. Burlington ledge looks well, is clearly defined, and free from all "entangling alliances." The shaft is down about forty feet, and is being worked day and night. The Clan Alpine, in the same vicinity, looks well; 16 tons of their ore crushed last week at Bodie's mill yielded \$86 per ton. Work on many other prominent claims remains pretty much as at my last.

In the town, building is going on steadily, and by winter time we shall have a number of as fine brick buildings as can be found east of San Francisco. The weather is warm, and the general health of the inhabitants is good."

**THE CRESUS**, owned entirely by Messrs. Cralle and Johnson, on Last Chance Hill, is down to the depth of sixty feet, and the rock increases in richness as they go down. The gold is plainly visible in most every piece of the rock assorted for crushing. Twenty tons have been sent to the Pine Creek Mill to be crushed.

One shaft of the Antelope is down 140 feet. The rock all the way down increasing in richness.

**SILVER** hill consolidation keep men steadily at work taking out ore and developing their mine. The Brodie mill worked a lot of their ore recently—the yield of which we have not yet ascertained.

According to the *Times*, the Howard Company have struck it rich. A ledge has been found which surpasses any ledge that has yet been found in any tunnel in Esmeralda District. The work of running through the ledge is progressing, and from present appearances it will take several days to work through it. The tunnel is in a distance of three hundred and forty feet, and is now in the mineral range and liable to find valuable ledges at any time.

There has been considerable talk about Bodie district within the last few weeks. From all accounts, the ledges and claims there are large and well defined, clear of all dispute, and, so far as opened, rich.

The Bamboo has nearly completed its air shaft, and rich developments are looked for, daily, in that mine. The Crockett is taking out large quantities of fine ore, and will soon have another crushing. The last lot of 80 tons yielded about \$80 per ton.

The Ural Company has ten men steadily at work taking rock from their vein. At the depth of 120 feet the vein is 7 feet wide with the rock improving, as the workmen descend.

## THE MINERS' LABORATORY.—NO. XIII.

## SILVER.

*Fahlerz*, (Grey copper,) lustre metallic, steel-gray, iron-black, dark red, rather brittle; specific gravity 4.5 to 5.2.

When heated in an open tube it yields fumes of antimony sulphuric acid, and sometimes arsenic. Before the blowpipe on charcoal, decrepitates, emits the smell of burning sulphur, deposits a sublimate on the charcoal, and melts easily into a steel-gray slag, which is usually magnetic; and with borax melts into a gray metallic globule of copper.

## ANALYSIS.

	1	2	3	4	5	6
Copper,	37.98	38.63	40.60	38.42	34.48	25.23
Silver,	0.62	2.37	0.60	0.83	4.97	17.71
Iron,	0.86	4.89	4.66	1.52	2.27	3.72
Zinc,	7.29	2.76	3.69	7.85	5.55	2.19
Antimony,	23.94	17.52	12.46	25.27	28.24	26.63
Arsenic,	2.88	7.21	10.19	2.26	—	—
Sulphur,	25.77	26.33	26.83	25.03	24.73	23.52

	7	8
Copper,	14.81	30.47

Silver,	31.29	10.48
Iron,	5.98	3.52
Zinc,	0.99	3.30
Antimony,	24.63	26.56
Arsenic	—	—
Sulphur,	21.17	24.88

Occurs in beds with talcite, chalcite, quartz, in veins with galena, blende and baryte.

*Freislebenite*: lustre metallic, steel-grey, streak the same, brittle, specific gravity, 6.00 to 6.38.

Before the blowpipe on charcoal deposits a sublimate of oxide of lead and antimony, and yields a globule of silver which sometimes imparts the color of copper to borax.

## ANALYSIS.

Silver,	23.76	22.81
Lead,	30.08	30.00
Iron,	—	0.11
Copper,	—	1.22
Antimony,	27.05	27.72
Sulphur,	18.71	18.77

Occurs in crystals, massive and disseminated.

This is a very rare mineral, and is found in veins in gneiss with galena, antimony, pyrrhyrite, pyrite, chalybite, calcite quartz.

*Proustite*; red silver, (in part,) lustre adamantine, cochineal red, carmine red; streak, aurora red, cochineal red; slightly sectile; specific gravity, 5.5, to 5.6, decrepitates when heated; melts easily before the blowpipe on charcoal, yielding sulphurous acid and a strong smell of arsenic, leaving a brittle globule, reducible with difficulty to pure silver. Partially soluble in nitric acid, leaves a residue of sulphurous and arsenic acid.

## ANALYSIS OF THE MINERAL PROUSTITE.

Silver,	64.67
Arsenic,	15.09
Antimony,	0.69
Sulphur,	19.51

Occurs in attached crystals, botryoidal, massive, disseminated and investing with other minerals, in veins with arsenic and ores of silver.

*Margyrite*.—Lustre Adamantine, fracture imperfect, conchoidal, opaque, blackish lead-grey, inclining to iron-black and steel-grey; in thin splinters blood-red by bevy sectile. Specific gravity 5.3 to 5.4.

## ANALYSIS OF MARGYRITE.

The various machine shops in New York, according to a recent calculation, employ about 7,500 men, and have all the work they can do.

## MINING PREMIUMS.

The "Washoe Agricultural, Mining and Mechanical Society," will present at their first Annual Fair, which is to take place, on the second Monday (12th.) of October, among their largest awards, the following important Mining Premiums:—

CLASS 13.—For the best geological cabinet, best collection of ores, best exhibit of gold specimens, best exhibit of coarse gold, best exhibit of scale gold, best exhibit of flour gold, best exhibit of copper ore, best exhibit of iron ore, best exhibit of galena ore, best exhibit of cinnabar ore, best exhibit of coal, best exhibit of salt, best exhibit of alum, best exhibit of gypsum, best exhibit of petrification, best exhibit of lead, best brick of silver bullion, best specimen of cast steel, best specimen of malleable iron, best specimen of rolled shafting.

CLASS 15.—For the best plan of tunnelling, best plan of timbering tunnels and shafts, best collection of mining implements, best steam engine for hoisting purposes, best horsepower for hoisting purposes, best derrick or whim, best dumping car or apparatus, best car track, best six tunneling shovels, best six crowbars, best six drills, best six sledges, best machine for tunneling by motive power, best quartz carrying wagon.

CLASS 16.—For the best arranged and most complete quartz-crushing mill in the Territory, 2d. best quartz-crushing mill in the Territory, 3d. best quartz-crushing mill in the Territory, best quartz-crushing machine, 2d. best quartz-crushing machine, best set of amalgamating pans, 2d. best set of amalgamating pans, best amalgamating process, 2d. best amalgamating process, best india rubber machine belting, best leather machine belting, best anti-friction journals, best self-oiling boxes for shafts, best brick machine.

## THE EMPLOYMENT OF STEAM.

The "Journal of the Franklin Institute" gives the following useful and practical ideas upon the Employment of Steam. They will be read with interest by the mechanical portion of our readers:—

HIGH STEAM.—It is well understood in the world of practical engineering, and is confirmed by correct theory, that it is much cheaper to make high steam than low steam, from the saving in fuel to produce equivalent power, the improved condition of heat convection in the boiler contents, the comparative losses by external radiation, and the resultant increase, by superheating. \* \* \* Up to a certain range of heating (550,) iron boiler-plates increase their strength, while below a certain tension, which is far within the limits of ultimate strain, a boiler is as safe from one pressure as another, in reference to the usual sources of danger from disruption and explosion, which rest so much on careful attendance. As a safety under working strain, we believe that there is little to be feared from steady pressure, even at ranges which may be called excessive, and we have slept over 180 and 200 pounds of steam, after some study of the attention of the firemen to the gauge-cocks, confident of as great safety as over one-fifth or one tenth the gauge.

SUPERHEATING.—Some positive means of giving all boiler steam the benefit of this process, should be adopted. Among all the extravagant claims of enthusiasts on this subject, which have induced a general re-action, too much has been proved as to its benefits to be lightly disregarded, up to a certain moderate range of application; and by this we mean an application more distinct and more clearly defined than the ordinary process of superheating common to boilers with chimney uptakes or steam domes. If saturated steam, by the addition of from 7 to 75 degrees of heat, will be expanded from 10 to 30 per cent., as some experiments have it, and such increment of heat can be conveniently taken from the wasted gases of combustion, there is great propriety in the application; and granting the special claim to be erroneous as to gain, if the steam can be fortified against the steam-pipe, chest, and cylinder radiations and condensations, so as to show the boiler pressure on the indicator-cards, even this result is worth the slight cost of attaining it. In most of our engines, the losses between the cylinder and boilers are formidable in their percentage of coal waste.

IMPROVED CONDUCTION.—It is urged by some authorities, and endorsed by experiment, that the use in boiler-flues of conducting-pins about 3 ins. long, projecting downward, into the heated currents, by presenting much more favorable points of heat transmission than the smooth surface of the flue-sheets, improves the evaporation. The application is simple and is justified by the conditions of furnace-flue action.

SUMMARY.—The general lesson taught by the diversified forms and operations of boilers, and the principles of their action, is, that the great majority come far short of available natural results, from imperfect design and management, and that the simpler forms are practically and theoretically to be preferred.

The largest cask in the world; that was, has had its light diminished. That of Heidelberg has now a rival in a cask recently made at Dover, England. Eight couples danced on the top. The cost of this monster cask was Two Hundred Pounds sterling.

UNION MINE, RUSS DISTRICT.—The following extract from a letter from a correspondent, at the Union Mine, Russ District, should have appeared several weeks since. Its delay has been caused by the letter having been accidentally laid. The writer had just arrived in that region to the charge of the above mentioned mine. He writes:—

"The day following I visited the Union Company's Mine (Eclipse Lode) of which I had engaged as Superintendent, and was agreeably surprised at the Champion like appearance of the same, and especially at the strong indications near the surface, of its becoming, in depth, productive. I may say that I felt a little proud, at the disappointment; when hearing of the time in which this mine has been in operation without any satisfactory results to the owners, I rather expected to have seen a lode of delicate promise, instead of being long in forming an opinion that the cause of delay of "glad tidings to the proprietors," was owing to scratching at surface, instead of developing the mine in depth. The Eclipse is a regular and well defined Lode, and has in its component parts all the prevailing characters of the most productive ledges in the State, and will, judged from present appearances and the vast amount of ground the Company claims, at no distant period, stand prominent in the Share List.

The work on this Lode is confined at present to the sinking of an incline shaft, and driving a cross cut tunnel. Both are being operated on day and night. In the incline shaft the lode is 10 feet thick, but at present, to facilitate its sinking, there is only 6 feet of it from the foot wall up being carried, most of which is so strongly impregnated with gold that I have recommended the Company to forward as many pieces for working the same in addition to our stamps, as the engine is capable of driving. The remainder of the lode is at present more adapted for silver and from the upper part is by no means difficult to break blocks of mineral of 500 lbs. weight, much resembling in appearance the Sheba. After a little further sinking in the shaft, we shall commence driving tunnels each way, on the course of the lode, sinking in a mean time. A cross-cut tunnel is now being run to intersect the lode at a depth of 300 feet under a portion of a vein, where, for a considerable distance, the croppings are remarkably well, and show much gold."

The writer of the above speaks encouragingly of the mine generally in that region, as well as the Owen's River and project.

LEARN TO FORCE YOUR OWN TOOLS.—Many mechanics, says the *Scientific American*, have an idea that after they have mastered the more legitimate duties of the workshop, they have learned all that is necessary, and can undertake anything in their line of business. Machinists particularly are prone to this error—a common one, by the way—I think that a knowledge of fitting and turning, once acquired, makes up for all other deficiencies. In reality, the self-styled finished mechanic is, paradoxically, the unfinished one; he who acknowledges his short comings, and tries to correct them by obtaining all the information he can, will acquire more thorough knowledge of his profession. Comparatively few machinists are competent to dress their own tools, and indeed, handle the blacksmith's hammer on any work. In many times such knowledge would have been invaluable to leave individuals to decide from their own experience. A simple weld which they were unable to make, a faulty dressing chisels without putting their own eyes in danger, striking the anvil instead of the tool, would assuredly be understood persons ignorant of such details in good service at a time of need. Apprentices who go to the tool-dresser to have the edges of their chisels or other instruments rendered, will do well to observe the process and inform themselves of it, instead of throwing coal at the helpers or otherwise conducting themselves in an unseemly manner. Observation and experience are twins and inseparable, and no youth or indeed any adult can hope to attain eminence or proficiency without paying some respect to the matters he is alluded to.

It is said that tobacco smoke blown into a wound is almost infallible cure for the lock-jaw.

GRAVITATION has been beautifully defined as the outspread hand of God forcing all things into their place and keeping them there.

**THE**  
**BRYAN BATTERY.**

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

**ALONE STANDING THE TEST.**

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

**METHOD OF CRUSHING ORE.**

The BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

**EXCLUSIVELY ADOPTED**

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

**EFFECTIVE, SUBSTANTIAL AND RELIABLE.**

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any place of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

**BOTH WET AND DRY CRUSHING,**

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,

**TREATMENT OF AURIFEROUS AND ARGENTIFEROUS COPPER ORES.**—An improved mode of manufacturing copper from ores has been provisionally specified by Dr. T. Fleitman, of of Iserlohn, Prussia, according to which the copper ores are first ground to powder; then one part of such powder is roasted dead, and mixed with the unroasted portion, and the whole is smelted with a suitable flux, such as silica or the slag of a previous process. The smelted mass is run into water, and the product ground to powder: and the process repeated until the resulting sulphuret of copper is in the desired condition. The sulphuret of copper obtained is ground to powder and roasted dead, then moistened with an alkaline solution. The oxide of copper is subjected to heat to melt the alkali, but not the oxide copper, which is then well washed in water: the product obtained is mixed with powdered carbon, and then melted.

**NEW SALT MINES.**—The bark Carib has lately discharged a cargo of salt at this port, from the mine known as Oje de Liebre, at the head of Scammon's Lagoon on the Pacific side of the Paninsula, Lower California, lying in latitude 28 degrees 10 minutes, and 114 degrees 50 minutes longitude. This mine is of great extent, and inexhaustible. The beds from which the salt is taken are ten inches to five feet in thickness, and continually forming.

**MORE GOLD IN CANADA.**—We hear from Canada of the finding of an abundance of gold on the tributaries of the River Chaudiere, about fifty miles above Quebec. One nugget weighing 20 ounces of pure gold was picked up in the bed of one of these streams. Another, weighing nine ounces, found near the same place, was sold in Quebec. The news has of course created a great excitement, and people are flocking in crowds to the spot.

## NON-DIVIDEND PAYING MINES VALUABLE.

The list of companies which we gave, in our Supplement exhibits a degree of activity in mining matters, never witnessed before, either in California or any other country. We notice, on the part of many of our contemporaries, a disposition to look upon this remarkable movement of organized capital as a matter of almost entire speculation. It is admitted that the stock of a few of the leading companies like those located upon the Comstock ledge, is valuable; but that outside of those, there is little else than "wild-cat." "Wild-cat speculation" is said to be the chief business of those engaged in getting up these companies, and nine tenths of the mining stock in the market, is pronounced "good for nothing except to excite the hopes of simpletons and thereby rob them of their money."

That there is a moiety of truth in the above may be correct, but we are not willing to admit that there is any adequate ground, whatever, for the sweeping charges which are so frequently brought against those engaged in the general mining operations of the day.

With many, all low-price stocks are looked upon as "wild-cat;" but with that definition of the term, there can be no medium between "wild-cat" and legitimate, dividend paying mines. All mines, with now and then a notable exception, must go through a process of development to ascertain their full value. There are certain indications upon or near the surface of every mine, well known to the experienced miner, upon which deductions of a favorable or an unfavorable nature can intelligently be made; and upon these the miner must determine his course of procedure. As the work of development progresses, these indications are more or less favorable; and of course the price of any particular stock meets with corresponding fluctuations, until such a time as the mine is fully developed, and becomes a regular, dividend paying institution. The price of stock is thereafter graduated by the amount of dividends which it can be made to pay.

The fact that thousands of mining companies are being organized at the present time, is simply an evidence that there are that number of promising lodes of mineral in the country which are worth prospecting. Any person who has kept himself posted in mining intelligence for the past few months, must be aware that within that time, an almost limitless extent of valuable mining territory has been opened up to explorers, throughout the entire extent of which mineral croppings and indications of most undoubted value have been found. When a vein is once discovered, it is usually found to traverse an extent of ground upon which from four or five to a dozen or more companies may be eligibly located. From forty-five to fifty companies have undoubtedly locations on the Comstock vein, besides a large additional number who claim such a location, but which may eventually prove to be upon side veins or spurs. The marvel is, under the circumstances, that there are not more, rather than less companies now organized. The plan now so generally adopted for prospecting and developing the mines is perfectly legitimate and equally as advantageous to the capitalist as to the miner. Ordinary precaution, only, is needed to guard reasonably against "wild-cat" operations.

A most erroneous opinion appears to be entertained, with regard to the value of non-dividend paying mines. The impression appears to be that if a mine, after a small expenditure for development, does not pay a dividend upon some fictitious value which its locators have seen fit to place upon it, the same must be abandoned as worthless. Of course the original stockholders in such an adventure are losers; but if they can secure one first class mine out of a dozen ventures, the successful one affords ample remuneration for the failure of the eleven. But even the eleven are not lost to the community or State. According to the usual average of mining chances it is safe to calculate that at least five of the eleven will pay the costs of working, after they have been opened at the expense of the twelfth; and by a wise provision of all our local mining laws, if a mine is abandoned by its original locators, for a certain specified time, any other person, who may choose to do so, can come in and work it—so there is no probability of any mine lying idle which will pay its mere working expenses.

A mining community may grow up and flourish, even, in a neighborhood which does not possess a single dividend paying mine. To illustrate, we will take one of the princi-

pal mines in Washoe:—The Ophir, in order to pay its present dividend of \$48 per foot, must yield \$140,000 per month about one half of which, or \$70,000, goes to pay expenses. Now it is quite evident, on a little reflection, that two mines, each employing the same number of men as the Ophir, but which are so poor as to barely pay the expense of working, are collectively worth more to the State in an industrial point of view, than the fabulously rich Ophir itself. Why? Because the two mines yield not only the same amount of bullion with the Ophir, but they also give employment to twice the number of men, at the mine; twice the number of foundrymen and machinists are employed to keep their works in repair and they draw twice the amount of supplies from San Francisco, that the Ophir does. Hence two "wild-cat" mines, whose stock may not be worth \$5 per share on Montgomery street may be actually of more value to the State and city than the famous Ophir which is valued to-day at \$2,500 per share! It is a fact, which to be known, needs only to be enquired into, that not one quarter of the mines in the State, whether placer or quartz, incorporated or private companies, have ever paid a dollar over and above a fair rate of wages to those employed upon them; and yet, the State has continued steadily to increase in wealth and population. San Francisco has maintained a steady, onward progress, values have been created all over the State, millions of treasure have continued to go East, each month, and California has come to be regarded as the mineral wonder of the world. The fact is, so long as our mines are free to the people and will merely continue to pay wages, just so long will California grow and prosper and San Francisco continue her onward progress.

We apprehend this is a view of our mining interest which is seldom taken; yet it is legitimate and correct, and furnishes a most convincing argument against the senseless tirades of the croakers who are continually prophesying bankruptcy and ruin as the result of the present "mania," as they term it, in mining operations. The fact is, mining has but just been commenced. The immensity of our mineral developments is fairly overstepping both our population and capital.

Everything was just upon the point of ruin three years ago because they were paying \$1,000 for the Ophir, \$400 for the Gould & Curry, \$50 for Chollar, and less even for Hale & Norcross, Potosi, etc.; while, as for such "wild-cat" mines as the Yellow Jacket, Best & Belcher, and a score of other mines of acknowledged present value, they were mere schemes "to excite the hopes of simpletons and thereby rob them of their money." The croakers of those days now wish they had been "simpletons" then. Let the croakers of to-day learn wisdom from the past.

**THE NELSON COPPER MINE.**—The proprietors of this mine, which is located about six miles above Lincoln, on the Nevada road, are making preparations for vigorous work in the way of its thorough development. A contract has been completed with a party for a quarter interest in the mine, to put up a 20-horse power engine with the necessary pumping and hoisting apparatus. The claim consists of 2,000 feet. The usual croppings of carbonates are found upon the surface, and considerable native copper occurs at a depth of about 27 feet. A shaft has been sunk to the depth of 70 feet, with most promising indications.

**THE NEWTON MINE.**—This mine is now raising a large amount of very superior quality of ore. Of the 600 tons of ore which went forward by the Mary L. Sutton, this day week, as noticed in our last issue, 200 tons were from this mine, though not reported at the time. This mine has been shipping about 100 tons of ore per month for the past seven months. But little is said about it, from the fact that it is conducted by a private company, who are satisfied with doing business in a quiet way. It is one of the most valuable mines in the State, and we are pleased to notice the progress of its development, as additional evidence of the increasing value of our Copper interest.

**LECTURE.**—Dr. Bourne, a well known citizen, gives a free Lecture, every Friday Evening, at Dashaway Hall. Our contemporaries speak favorably of these Lectures. They are pronounced both interesting and instructive by those who have heard them.

## THE NEW SOUTHERN MINES.

Most extraordinary reports continue to reach us from the new mines in the San Francisco Mountains. These mines are located on the Agua Frio river, about 300 miles in an Easterly direction from San Diego. They have already been prospected for an extent of 150 miles, throughout which extent, it is said gold is found everywhere. There is sufficient water for domestic purposes and for stock, and for mining with rockers only, but not for sluicing or even for a tom. This is the report of prospectors who have recently gone over the country. Of course, when the rains set in the water will be more abundant. The climate is represented as being unsurpassed. Plenty of grass and timber; valleys luxuriant, water in them to be found almost everywhere by digging a few feet.

## THE MINING SHARE MARKET.

A fair degree of interest has been manifested in Mining Matters during the past week. The "Mining Roll" has materially lengthened, and about the usual number of "Organizations," have been completely according to the requirements of the Incorporation Act. During the week we have published a list of 969 Incorporated Mining Companies, who have their places of business in this city. Were the list complete it would, in all probability, exceed 1200.

An important feature of the week has been the sale of the New Almaden Quick-silver Mining Company for the round sum of \$1,750,000. Payment is to be made to-morrow. The negotiation has been conducted by telegraph. This sale will put an end to the vexatious litigation in which this mine has been so long involved, and will place beyond peradventure any further interference with the working of these mines, whose regular yield of quicksilver is of the utmost importance to the entire mining interest of the State.

Ophir Shares opened at \$2,425. The sales of the week reached 288 shares, at rates fluctuating between \$2,425 @ \$2,525, and closing at \$2,420. The fluctuation has been owing to the uncertainty with regard to the approaching dividend—operators being in doubt as to whether the Company, after failing to declare a dividend for last month, will be able to increase their dividend for the present month to their former standard of \$72 per foot.

Gould & Curry shares have declined considerably during the week. Twelve shares only have changed hands since our last report at \$4,750 @ \$4,775. A dividend of \$150 per foot was declared on Wednesday. At the close of the week these shares were offered at \$4,550 without takers.

No transactions are reported in either Chollar or Hale & Norcross.

Potosi shares have declined about \$75 dollars from last week's quotations and are now quoted at \$900 @ \$950. They have been considerably sought after at \$950 on 30 days, but cash is demanded.

Sierra Nevada have not been so much sought after as last week. They have declined somewhat with light transactions. They are quoted at \$93 @ \$100.

Daney shares have been largely dealt in at rates greatly fluctuating. Sales of 1140 shares are reported at \$100 @ \$144. [The week previous 597 at \$105 @ 150.] These transactions have been produced by variable reports from the mine, which is flooded. Much uncertainty exists as to the amount which will be required to put it in good condition again, which sum must be raised by assessments.

Buckeye has not attracted so much attention as for the two previous weeks. Sales of 283 shares at \$34 to \$40, closing at a slight advance on last week.

Burning Moscow is again attracting attention, at considerable advance. Sales of 202 shares are reported at \$80 @ \$108½. It closed the week with a firm market, at \$105—\$20 improvement on dull sales of the previous week.

Savage. Transactions in this stock still continue light, and at declining rates. Sales of seven shares are reported at \$3,300. This Company has just declared its first dividend (payable to-day) of \$50 per foot. It is understood that a balance of \$35,000 is retained for the purchase of winter supplies. \$80 per foot is confidently expected hereafter.

Overman, for which \$510 was bid at the close of the previous week without finding sellers, found buyers at \$650, early the past week, after which it declined to \$465, closing at \$475. \$85 better than the lowest bid of the week previous. Seventy-two shares have changed hands during the week.

Yellow Jacket has been dealt in to some extent; 34 shares having changed hands at \$1,050 @ \$1,125.

North American still continues in favor, with large sales. 39 shares have changed hands at \$58 @ 75, closing at \$58. We reported the previous week's sales, 418 shares from \$50 @ \$67.

Baltimore American has been largely dealt in at remarkably fluctuating rates. Sales of 807 shares are reported at \$110 @ \$110. These shares opened at \$80, advanced to \$110 on Tuesday, fell to \$45 on Wednesday, then recovered to \$57½ and finally closed the week at \$50 with a weak market.

We notice further sales as follows:

	White and Murphy	10 shares	\$700	per foot.
Best & Belcher	4	"	950	"
Jurisd.	60	"	5 @ 5½	"
Adriatic	20	"	3¾	"

Great Western Tunnel	25	"	3	"
Sheba	29	"	160 @ 170	"

Esmeralda stocks still remain comparatively quiet and are but little enquired after.

Wide West is dull at \$132½; Silver Hill at \$27. Ural has met with light sales at \$210.

Real del Monte has found buyers at \$375, at which figure 25 shares have changed hands.

Pond has been considerably dealt in, the past week; 201 shares have changed hands at from \$25 @ \$35.

We quote further sales as follows:

Wide West	114	"	132 @ 146	"
Silver Hill	25	"	26 @ 27	"
Ural	5	"	210	"
Nevada	20	"	18	"
Falls of Clyde	98	"	4½ @ 5½	"
Josephine	23	"	12 @ 12½	"
Willow Springs	10	"	7	"

#### COPPER.

There is no apparent abatement in the Copper interest. New mines are constantly coming into notice, and the regular shipment from established mines is constantly increasing.

The Newton mine, from which little has been heard of late, still continues its regular shipment of ores at the rate of about 100 tons per month.

The Napoleon still continues its usual shipments, which appear to be limited only by the facilities for transporting the ore from the mine to steam navigation at Stockton. The daily reports from the mining Superintendent are most encouraging. The lode is constantly improving. Two immense blocks of ore have been blasted out and raised from the main shaft, within a few days past, which will be placed on exhibition at the approaching fair at Stockton.

The Keystone is working a large force, and concentrating the lower grades of ore. Shares in this Company are held at \$170 per foot in Stockton, with \$150 offered.

Much interest is felt in the success of the concentrating machinery which is being put up by this company. Its success will add largely to the value of the copper interest, not only at Copperopolis, but also in all other parts of the State.

The Camp and McNulty Copper Company and Hughes claim are said to be progressing well.

The Josephine Company, is about contracting for 75 feet

of tunneling, which it is believed will bring them to the Napoleon lode.

There is a large amount of prospecting being done in the vicinity of Copperopolis, with most flattering indications of success.

The Campo Seco Mines are reported doing well and before the season closes it is thought ore will be again shipped from the Lancha Plana, Lone Star and Campo Seco Companies.

The Lancha Plana Company are turning out some excellent rock. The Campo Seco Company have built a splendid water wheel on their claim for the purpose of pumping out the water and raising the ore. The Lone Star Company have struck paying ore. There are several other claims which are reported as doing well.

Fifty-five tons of ore from the Well Lead, Nevada county, arrived at Sacramento the past week, *in transitu* for the Antioch Smelting Works. This is one of the earliest copper mines opened in that section of the State, and it is expected the mine will, hereafter, be able to ship that amount weekly, which amount will be gradually increased to fully a hundred tons within a few months.

The Home Company, located, if we mistake not, in El Dorado County, made their first important shipment of 20 tons of ore to this City during the past week. This ore is to be shipped to Swansea by the Pacific Mineral Company of this City.

We have nothing of special interest from Butte or Del Norte counties.

Considerable attention is being directed to the copper mines of the Colorado. Some very valuable discoveries are reported most conveniently located for shipment down the river. A party in this city assured us, the past week, that he had assayed ore from sixteen different lode within a few days all from that region, none of which fell below twenty-five, and from that up to eighty per cent.

#### REPORT OF BIDS

At the San Francisco Mining Stock Board,

For the week ending Aug. 29, 1893.

Names of Companies.	Total No. Shrs.	Shares per ft.	Par Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.

#### SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

**THE COLORADO RIVER TRADE.**—Gentlemen recently from the Colorado state that business along that river is brisk, in consequence of the extensive mining operations going on in that region. Three steamers are now plying on the river and another is in process of construction. The channel of the river is being sounded, with a view to putting on a still larger line of boats. Vessels clear from this port for the mouth of the Colorado, where they discharge their cargoes into the steamers, which transport them thence up the river to the mines. It is anticipated that there will soon be shipped hither full cargoes of copper ore from this rich, yet comparatively undeveloped region.

**THE "Los Angeles Consolidated, Copper Gold and Silver Mining Co.,"** located in the Soledad Mining District, was incorporated on the 28th of January last, and have been working since the 3d of February, on the "Miller" Copper Lode, with following results. This Company has also commenced running a tunnel on the Spence Native Copper Lode, on which they have attained a depth of 80 feet. But little of the stock has been offered in this market, publicly, although a considerable amount has changed hands at from \$7 @ \$10 per foot.

**TREASURE FROM THE NORTH.**—The Seirra Nevada arrived from Victoria on Thursday last, bringing down the handsome sum of \$440,355, in treasure.

This dust is mostly from the Bannock mines, in Idaho. This arrival also speaks of a large yield of about thirty claims at Cariboo, which is reputed as averaging about \$1,600 each per month.

**THE OPHIR MINE.**—The Virginia City Union of 20th August, says:

The new and rich vein struck in the Ophir a few weeks since continues to hold out well, a large amount of ore being extracted daily. It has been opened for a distance of fifty, and about twenty-five laborers are constantly engaged in still further developing it. A shaft is being sunk about fifty yards northwest of the engine house, and a new and substantial track has been laid from it to the dump pile. A vast amount of earth has already been removed by the new drifts. The "cave" still looks as if it were a lucky strike. Ore is not yet being taken from the lower mine.

## 50 lbs. MARINE and Fire-Proof Paint,

**MANUFACTURED BY THE PACIFIC METALLURGICAL** Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

### DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mixed with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

### 25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

### DIRECTIONS:

**HOUSE:**—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.  
**ROOF:**—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.  
S. C. BRADSHAW, Agt.,  
G. T. FOUQUE, Superintendent.

## WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. sol6-tf ZENAS WHEELER.

Moulding Irons,

Stone Cutter's Tools, etc. No. 22 Fremont street, bet Market and Mission, San Francisco, July 14, 1863. jy 20

How SOLDIERS DESTROY RAIL-ROADS.—A letter from Gen. Grant's army to *The Springfield (Ill) Journal*, describing the recent operations of our forces near Jackson, says:

Our operations on the railroad were of a novel character.

The regiment would be formed into line on one side of the track, and at the command every man would take hold on the end of a tie or a rail, and, straightening up, would lift the track from its bed, completely capsizing it. Then, piling the ties together and setting them on fire, we laid the rails across rendering them unfit for future use."

**Eye, Ear and Throat.**

**DR. DE CASTRO,**

Oculist and Aurist,

**WHO HAS PRACTISED IN NEW**

York and all the principal cities of Europe with such unrivalled success, and from each place in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. Deafness of long standing thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**Self-adjusting Artificial Tympanum,**

For the relief of deafness, attended by loss or injury of the membrana tympani, and for the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November, 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state; the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

Dr. Mr. Editor—Having been afflicted with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent one operation, and it is with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist.

JOHN REESE, Napa Valley. James Callaghan, witness, San Francisco, July 30th, 1863.

[From the Daily Alta.] San Francisco, June 30th, 1863.

ED'S DAILY ALTA: Permit me through your widely circulated journal, to say that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearny and Market Streets, and undergoing under his direction, two operations, she has heard sounds very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physicians and aurists in California, but up to the period of visiting Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT, 812 Green Street.

**APARTMENTS.**

FURNISHED APARTMENTS, WITH, OR WITHOUT Board, at 1018 Powell Street, between Clay and Washington Street. Persons desirous of a respectable home will do well to apply jy6

**To Mining Companies.**

FOR SALE.—A STEAM ENGINE AND BOILER. The Engine is 20 horse power—10 inch cylinder—24 inch stroke—solid iron frame, with heater, pumps, etc., all complete. The boiler has 5 flues, is 24 feet long, 40 inches in diameter, made up from the best three-eighths inch Low Moor Iron, and weighs about 5000 pounds.

Both Engine and Boiler are in perfect order and fully guaranteed. Apply to I. H. HAM, No. 211 Clay st. San Francisco, June 13, 1863.

**MINING CERTIFICATE LOST!**

Certificate for Ten Shares, No. 33, dated July 8th, 1863, of Tamahua Gold and Silver Mining Company. The finder will be suitably rewarded by leaving it at room 24. Government Block. LOUIS EDWARDS.

## MINING NOTICES.

**Winona Gold and Silver Mining Company.**—The first annual meeting of the stockholders of the Winona Gold and Silver Mining Company, will be held at the Company's office, No. 428 Montgomery street, for the election of five Trustees for the ensuing year, on the 19th day of September, 1863, at 7½ P. M. By order of the Board of Trustees. M. G. ELMORE, Sec'y. aug24

**Red Jacket Mining Company.**—At a meeting of the Board of Trustees of the above company held July 7, 1863, the first assessment of Five Cents per share on the capital stock was levied, payable immediately in United States gold coin, to the Secretary, office 420 Montgomery street, Room No. 2. By order of the Board. J. W. CROSLY, Secretary. aug24

**Office Table Mountain Copper Mining Company.**—At a meeting of the Board of Trustees of this Company, held July 28, 1863, an assessment of Thirty Cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin to the Secretary, at the office of the Company, No. 528 Montgomery street, or to J. M. Pike, Superintendent, at Copperopolis. M. G. ELMORE, Secretary. aug24

**Grey Ledge Gold and Silver Mining Company.** Office No. 528 Montgomery street, San Francisco. All stock on which assessment is not paid will be advertised as delinquent on the TWENTY-FOURTH DAY OF AUGUST. M. G. ELMORE, Secretary. aug24

**Office of the Niagara Consolidated Gold and Silver Mining Company.** Elwood Canon.—Notice is hereby given that the Board of Trustees have this day levied an assessment of Twenty-five Cents per share upon each and every share of the capital stock of the said Company, payable in U. S. gold coin immediately to the Secretary, at the office of the Company, No. 528 Montgomery street, or to the Contractor at the Canon. M. G. ELMORE, Secretary. aug24

**MINING & SCIENTIFIC PRESS.**

**THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.**

**THIRD YEAR! VOLUME VI.—NEW SERIES**

A new volume of this extensively circulated paper,  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits  
together with several original engravings of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietary to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

**The Mining Interest!**

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Min-  
ing Stocks, new inventions of Machinery adapted to the  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

**The Inventor!**

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with fac-  
ilities at Washington that enable them to obtain Patent  
with dispatch.

**The Mechanic and Manufacturer!**

Will be greatly benefited by its perusal, as the  
numbers contain from time to time contain original en-  
gravings of new machines and inventions, together with  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

**To Chemists, Architects and Millwrights**

This journal will be invaluable. All new discover-  
ies in Chemistry will be given, and a large amount of in-  
formation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will be kept abreast of the progress of the agricul-  
tural implements, and the farming interest gen-  
erally will be amply discussed.

#### Terms.

To mail subscribers—Four Dollars per annum  
**Club Rates.**

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscrip-  
tion is only \$2 80. Names can be sent in at dif-  
ferent times and from different Post-offices. New  
copies will be sent gratis to any part of the country.

PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, SEPTEMBER 7, 1863 NO. 45.

#### THE REAL DEL MONTE MINE AND MILL.

One of the most promising mining enterprises on the Eastern Slope, at the present time, is that of the Real del Monte, Consolidated Gold and Silver Mining Co. The Company is now putting up a mill, which will be a cond to none on this Coast. Its cost will be about \$150,000. The location of mill is described by a correspondent of the *Alta* as a pleasant situation at the junction of Bodie Creek and Esmeralda Gulch, about two miles from the mines of Last Chance Hill. The main building is 160 by 60 feet, with an engine room adjoining, 36 by 47 feet. The mill will have 30 stamps, with 24 of Wheeler's pans, and 12 separators.

The rock, on reaching the mill, first passes under two ponderous stamps or "spallars," weighing 1700 lbs. each, working upon dies, enclosed by iron grating. These stamps have three feet fall and merely break the rock sufficiently fine to pass thence under the battery. This crushing apparatus is placed in front of the battery, and at a convenient elevation above it. The mill is capable of crushing about 45 tons of rock per day, and will be in full operation about the first of November next.

#### THE ENGINE.

The Mill is to be driven by a beam Engine, having a cylinder of 16-inch bore with 36-inch stroke, with balance valves of the most approved style, and Winter's variable cut-off arrangement, which gives the engineer the most perfect command of the steam, from the full stroke down to three-eighths.

This Engine has been built at the Miners' Foundry, where the finishing work is now being put upon it, and is one of the best pieces of work in that line which has ever been turned out on the Pacific Coast.

In the design of this Engine the gothic style of architecture has been generally observed. It is constructed upon substantial foundation, 17 feet long and 5½ wide, securely bolted and bolted. Two gothic arches rise from the centre of the foundation plate, as supports for the beams, which are beautifully ornamented and painted with Union emblems, among which appear, at different points, 13 brilliant stars, the whole surmounted with an elegant gilt eagle. In front of the Engine, is a convenient platform from which two columns arise, the one on the left containing the throttle valve, and that on the right the unhooking gear. They are so arranged that the engineer can readily work both at the same time, and also work the engine by hand, without changing its position.

One peculiarity, deserving of especial attention, connected with this Engine, is the arrangement of a rotary cam or rock shaft for working the valves. One important advantage claimed for this arrangement is that the valves may be opened and closed very quickly; another advantage grows out of the facility with which the exhaust valve may be made to follow the steam valve at exactly the proper distance—a result impossible to be accurately obtained with a vibrating shaft. The rotation of the cam shaft is obtained by suspending the excentric rod by a movable link attached to its centre. This, we believe, is the first time this motion has been applied to a steam engine on this coast. The govern-

or is conveniently arranged and is exactly balanced, and, running by a gear, is not liable to any possibility of irregularity in motion; and will throttle the engine at the slightest appreciable increase of speed.

This machine was designed and draughted by Mr. I. M. Scott. The entire work, both in design and execution reflects great credit upon the parties named. It will be driven by two tubular boilers, each 16 feet long and 50 inches in diameter. The balance wheel, which is cast in sections, is 18 feet in diameter and weighs about five tons.

When this mill is in full operation, our friends in Aurora, will be able to point out to visitors in that region a mill and engine, which in completeness and substantial finish, will compare favorably with anything in Virginia City, not forgetting the famous Ophir or justly lauded Gould & Curry Mills.

The Aurora lode, one of the Company's Consolidation claims, is in splendid working order. The lode has been opened out in chambers or tunnels, intersecting for the distance of 400 feet, by which means 100 tons can be taken from the mine daily. The face of the ledge is now 16 to 18 feet wide, all pay rock, and will average from \$125 to \$150 per ton. The richest of the ore taken from the mine, is being sacked and reserved until their mill is ready for active operation.

#### LARGE BRASS CASTING.

Passing by the Miners' Foundry, a few days since, our attention was directed to a large piece of brass work upon which the workmen were engaged in the area just above the Office. On enquiry, we learned that it was designed for a double acting Force Pump for the "Silver State Reduction Works."

The Cylinder was a 14 inch bore, allowing a 36-inch stroke, and weighing 1600 lbs. This, we believe, is the largest brass casting ever made on this coast. It was handsomely finished, with two valve chambers of cast iron, each surmounted with a copper air dome, four feet high and 22 inches in diameter. The suction and discharge pipes were each 12 inches in diameter. The work was designed by Mr. I. M. Scott, Draughtsman for the Miners' Foundry, and appears to be especially well adapted for the work for which it is designed.

It is the intention of the Company to place this pump in their mill for the purpose of meeting the exigency of fire. A large tank will be placed upon the comb of the roof, extending its entire length, with its floor or bottom perforated with a large number of holes, thus making it like a sieve. In case of fire this force pump will be set in motion, throwing a constant 12-inch column of water into the tank, which will thence be distributed over the roof and down the sides of the building, thus enveloping it in a complete sheet of water, while for the inside, hose are attached to the bottom of the tank in such a manner as to completely flood the interior of the building at the same time. The idea is a most excellent one, and we would suggest its adoption by all our large mill establishments. Such an arrangement, kept in working order, with power at hand for instant application, must be an effectual safeguard against any possible serious loss by fire.

#### THE GOLD MINES OF WALES, (ENG.)

The English papers are still giving favorable accounts from the gold mines of Wales. Mr. J. Mosheimer, formerly of this city, now operating in those mines, writes to the *London Mining Journal*, of July 18th, as follows:—

"To prove that the gold fields of Wales are not yet exhausted, I will give you a few facts of a new discovery near Bala, in the so-called Castle Corn Dockan Mines. The lode is directly under the ruins of an old castle, and no doubt, the former occupants built their strong hold to guard their treasure underneath. It is remarkable that the gold there had not been discovered long before this, as all the loose boulders on the ground contain visible gold, and even in the wall built with those boulders the gold could be seen. The finding of this valuable discovery is due to a boy of about twelve years of age, who, while playing among those rocks, found gold in perfectly white quartz. The property is worked by a company who have opened the lode to a depth of 20 feet, where it is three feet wide, with decomposed quartz."

Mr. Mosheimer took a sample of the rock, and subjected it to a practical working by crushing and amalgamating, and obtained a yield at the rate of ten ounces to the ton. The Company has ordered machinery for the mine, which will be put up with all convenient dispatch.

One John Perry communicates to the same issue of the *Journal* the following:—

"It is likely some of your readers will be glad to learn that I have discovered, this week, in one of our mountain hills, a lode containing splendid visible gold. This is a great encouragement to go on still with our efforts, and I dare say this discovery will have great influence on the interest of several mines situated around it. You may expect some further particulars with regard to this very shortly."

#### GOLD IN SCOTLAND.

Scotland contains both gold and silver mines. Gold is not unfrequently found on the mountain sides, after heavy rains, in grains or attached to pieces of quartz and sapphire. There is a gold mine on Crawford Moor and another on Fryer Moor, in Clydesdale. There are also two other mines in Widsdale, and three on Glangaker Watten, in the Forest of Attire. One Cornelius once discovered a gold mine at Crawford John, and in thirty days time took to the mint, at Edinburgh, eight pounds of native gold, worth about \$22,000. Scotland also contains valuable mines of lead, iron, copper, etc.

THE COPPER MINES OF PRUSSIA.—The high price of copper has caused a greater activity than usual in the copper mines of Prussia within the past two years. The produce of 1861 was 2273 tons against 1964 tons in 1860. The average yield of ore not far from 300 tons to each mine worked.

POWER OF POWDER.—A distinguished engineer officer, who took a prominent part in the bombardment of Fort Pulaski, has made a calculation based upon the destruction caused by the late powder explosion in Eighty-sixth street, New York City—that had our artillery succeeded in exploding the enemy's magazine at Fort Pulaski, to which its main effort was directed, the result would have been the annihilation of both the opposing forces. No man would have been left to tell the tale, no stone left upon another to mark the sight of the contending foes.

## THE MINERS' LABORATORY.—NO. XIV.

## SILVER.

*Kerate.*—Chloride of silver, Hornsilver. No cleavage observable. Fracture conchoidal; uneven, earthy, transparent, translucent on the edges. Lustre waxy inclining to adamantine. Pearl-grey, passing into various shades of blue and green, yellowish white. Grows brown when exposed to light. Streak shining malleable, and sectile. Specific gravity, 5.55 to 5.60. Before the blow-pipe, melts very easily, with ebullition, and is gradually reduced into a globule of silver in the inner flame. Is reduced when rubbed with water on iron or zinc. Soluble in ammonia and crystallizes from the solution in octahedrons.

## ANALYSIS OF THE MINERAL KERATE.

	1	2	3
Silver, .....	67.75	76.00	68.00
Chlorine, .....	27.50	24.00	32.00
Red oxide of Iron, .....	6.00	—	—
Alumina, .....	1.75	—	—
Sulphuric Acid, .....	0.27	—	—

This mineral is found in crystals, reniform, investing other substances and massive in veins in the older rocks with some of the other ores of silver, is found in nearly all the silver bearing localities—considerable quantity is found of it in the California and Nevada silver mines.

*Embolite.*—Fracture hackly, lustre adamantine, sulphur yellow; siskin-green on a freshly fractured surface; olive-green on the exterior perfectly malleable. Specific gravity 5.789 to 5.806.

## ANALYSIS.

Bromine, .....	20.09
Chlorine, .....	13.05
Silver, .....	66.86

*Bromide.*—Bromide of silver—Bright, olive green, passing into yellow, acquires a grey tarnish, streak siskin-green; specific gravity, 5.8 to 6.0

It melts very easily before a blowpipe. Is but feebly acted upon by acids, soluble in warm concentrated ammonia.

## ANALYSIS OF A SPECIMEN FROM MEXICO.

Bromine, .....	42.5
Silver, .....	57.5

Is found rather abundantly in very small crystals and crystalline grains, with Iodate and cerussite in the mine of Sanonofre in the district of Plateros in Mexico, and with Kerate in the silver mines of Copiapo in Chile.

*Iodide.*—Iodide of Silver—Transparent, translucent, lustre resinous, approaching to adamantine, yellowish-grey, greenish-yellow, streak shining, specific gravity 5.504.

Before the blowpipe on charcoal it becomes red; melts very easily and imparts a purple color to the flame; in the inner flame yields a globule of silver; soluble in concentrated nitric and hydrochloric acids with evolution of vapor of iodine.

## ANALYSIS.

Iodine, .....	36.88
Silver, .....	64.25

## MINERALS NOT MUCH KNOWN—IMPERFECTLY DESCRIBED.

*Gold Amalgum.* In small white globules, in the Platinum Steam Works of Columbia.

## ANALYSIS.

Gold, .....	38.39 per cent.
Mercury, .....	59.40 " "
Silver, .....	6.00 " "

*Aphphorite.*—Steel-grey, compact, specific gravity 4.87; melts easily before blowpipe.

*Blende.*—Sulphuret of Zinc; very frequently contains small quantities of both gold and silver. There is not anything in the appearance of the blende to indicate the presence of silver. Should parties come across deposits of this mineral, it would be better that they pass it over to the hands of an experienced assayer, to prove the presence of the precious metal and also to what extent.

## THE ANTIOCH SMELTING WORKS FIRING UP.

We have been informed that the furnace of the California Copper Smelting Works, at Antioch, has been in operation since the 2nd of this month, but they are not ready to smelt as yet; the Superintendent requiring some two or three weeks to heat and prepare the furnace. We shall soon be able to form an accurate idea as to the value of Mount Diablo coal for metallurgical purposes. The furnace, we understand, is to all intents of the same kind as those now in use at Swansea, South Wales, Great Britain, with the exception of the fire place, which has been modified so as to allow the use of the lignite coal. Should this coal produce the necessary heat for the smelting of copper, we see no reason why the present enterprise would not be a profitable one; and if so, at no very distant date, we shall have other manufactories of a similar character, along the foot hills of old Diablo, on the sides of the road leading thither and along the banks of the San Joaquin. Our hearty wish is success and good luck to the young copper smelters.

## BATTLES AND RAINS.

The theory of Professor Espy that rain may be produced in any locality by that disturbance of the atmosphere which results from great or continued conflagrations, is supposed to have found confirmation during the present rebellion. It has certainly been remarked that rain showers of considerable violence and duration have generally followed or attended all the great battles of the present war, in which an unusual proportion of the heaviest class of ordinance has been employed. Indeed, it would appear by accounts from the South, that the very climate of that region, has been effected during the past and present season. The usual diseases peculiar to many localities, there, have been almost unknown. The weather has been cooler than usual, more rain has fallen and the atmosphere appears to have assumed a more health-giving and enervating influence than ever before known during the Summer season. Whether this is attributable to the chemical effects of burning such an immense amount of "villanous Saltpetre," or to the tremendous concussions produced by the extraordinary weight and amount of artillery employed, or to some other cause may at some future time, be made a matter of serious enquiry.

Unfortunately for the theory of Professor Espy, however, the circumstance that rains usually follow great battles, was a noticable and recorded fact even before the employment of firearms in war. An Eastern cotemporary has hunted up the following paragraph, which occurs in Plutarch's life of Caius Marius, who, in speaking of a great battle that occurred some fifteen hundred years before the use of gun-powder in Europe, says:—

The opinion of Archibolus is confirmed, that fields are fatened with blood. It is observed, indeed, that extraordinary rains generally fall after great battles; whether it be that some deity chooses to wash and purify the earth with water above, or whether the blood and corruption, by the moist and heavy vapors they emit, thicken the air, which is liable to be altered by the smallest cause."

THE PACIFIC MONTHLY for September has been laid upon our table. Its contents are, as usual, varied and interesting and marked with a good degree of literary ability. We notice especially a very valuable article on "The Mines of California," from the pen of John S. Hittell, Esq.

## NEW THEORY OF THE GENERATION OF STEAM.

We have now before us the second edition of Mr. Williams' work "On Heat, in its Relations to Water and Steam; embracing new views of Vaporization, Condensation and Explosions," in which the new theory is carefully demonstrated. Mr. Williams considers the subject under thirteen heads, including the three states of water, Vaporization, diffusion vapor, heating and expanding of water, the boiling point, ebullition, vapor in water, condensation, the vacuum, evaporation, spontaneous evaporation, explosions and the jet, respectively. The position which Mr. Williams maintains is that there are sufficient scientific and reasonable grounds asserting that water, or its atoms, can neither be heated nor expanded, and still retain the character of liquidity, and the property of attraction among their fellow-atoms; that the prevailing theories as regards ebullition are altogether erroneous; that the so-called boiling point, as regards temperature, is merely that point at which the water is charged with vapor to saturation, under the true Daltonian theory, the water acting the part of a mere vacuum; that we have strong grounds for believing that there is no difference between a cause which produces divergence and mutual repulsion among the atoms of a liquid on becoming vapor, and that which produces a similar divergence and repulsion in the pith of gold leaves of the electroscope; that if there be such thing as thermo-electricity, we are warranted in concluding that it acts in the same way, and on a similar principle, atoms of a liquid as on those of other bodies; that we have rational grounds for believing that explosions in steam boiler are frequently the result of the accumulated steam (pressure in the body of the water) being suddenly released by the removal of the pressure from the denser medium of the water into the lighter one of the air; that Watt's theory of steam being condensed and reconverted into the liquid state by direct action of cold water is altogether erroneous; that vapor or steam cannot give out its heat to water, and is mixed mechanically with it on the true Daltonian theory; and that we have no grounds for inferring that there can be more heat in the body of steam than there are distinct atoms of the matter of water, each of such atoms having its own equivalent of heat electrically or otherwise combined with it—accumulation being the sole grounds of expansion and pressure. In judging of the value of Mr. Williams' conclusions, it should be borne in mind that his experience, which extends over a period of nearly half a century, has been gained in connection with two of the largest and most successful steam companies in the kingdom—the Peninsular and Oriental Steam Navigation Company, and the City of Dul Steam Packet Company, and that he has always given much attention to the subject.—*London Mining Journal.*

The *London Mining Journal*, in another issue, referring again to the above theory of the generation of steam, speaks of a paper read before the Liverpool Literary and Philosophical Society, by Mr. E. J. Reed. The object of the paper was to show that the first effect of applying artificial heat to water is not to heat the water, as such, but to convert a certain portion of it into vapor. Mr. Williams (the discoverer of the new theory), first drew attention to the fact that the rise of the generated vapor, and its diffusion through the liquid were plainly visible to the eye, a discovery which seemed to have escaped all previous experimenters. Edwards, an analytical chemist of Liverpool, exhibited a beautiful experiment illustrative of this discovery, by means of an electrical light. On heat being applied to a glass vessel containing water, instead of the series of ascending and descending currents described by all previous writers, a continuous movement upwards of cloud-like vapor was made visible to the audience. After explaining this discovery, length, and demonstrating that the movements made visible were those of vapor and not heated currents of water, the author drew several important inferences from the phenomenon, such as that it is untrue to say, as many authors do, that vapor is formed at the surface of water only; that water, even when of a low temperature does not condense vapor, reconvert it into water; that water is capable of containing, and, when what is called warm or hot, does contain condensed vapor or steam. It was urged that Mr. Williams' discovery rendered a revision of the common theory urgently necessary.

AN ELECTRIC DOG.—There is at Dayton, (says the *Virginia City Bulletin*), decidedly the greatest phenomenon of the present day. It is no less than an electric dog, which, when rubbed on the back by a human hand and the other placed on the dog's belly, the person experimenting will receive an electric shock equal to that of any battery. This singular canine is said to possess properties for curing rheumatism, gout and all other complaints subject to cure by the battery.

Agents for the Patentee.

Every Buckle sold, stamped "W. Bohm," will be  
guaranteed as to its Strength and Durability.  
W. BOHM, Patentee.

**THE**  
**BRYAN BATTERY.**

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of  
the most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

**ALONE STANDING THE TEST.**

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

**METHOD OF CRUSHING ORE.**

THE BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

**EXCLUSIVELY ADOPTED**

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

**EFFECTIVE, SUBSTANTIAL AND RELIABLE.**

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

**BOTH WET AND DRY CRUSHING,**

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1830, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing completely about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cut in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,

**DEVELOPEMENT OF MINERAL WEALTH IN**  
**ARIZONA BY GOVERNMENT.**—A private letter  
by Gen. J. R. West, dated Hart's Mills, Tex-  
as, August 1st, to a friend in San Francisco,  
has the following important intelligence:

Say to the gentlemen in *feet*, that it has  
been stated every way but officially yet, that  
I am to command a body of troops whose spe-  
cial mission, while exterminating the Apaches  
will be to settle and develop the mineral  
wealth of Arizona. This wealth is almost  
fabulous. I had proposed writing you what  
had been officially communicated to me in  
regard to the recent gold discoveries near  
Tucson, but as I may probably visit that sec-  
tion of the country ere long, I will defer do-  
ing so until I can give you my personal ex-  
perience. In my opinion, Arizona will yet  
startle the world as much as ever did Cali-  
fornia or Washoe, with mineral wealth.

## DISCOVERIES IN CHEMICAL SCIENCE.

Discoveries in chemical science, for the past few years, have followed each other with such rapid succession, that the working chemist has almost ceased to be surprised at any announcement of new discoveries in that branch of research. His chief ambition seems to be that he too may be fortunate enough to be able to announce some important fact, which shall place his name conspicuously upon the roll of discoverers. Indeed no chemist of the present day considers himself entitled to much consideration until he has made an actual addition, in the way of some valuable discovery, to the domain of his favorite science. So far from perfection is the science of chemistry supposed to be at the present time, that an eminent chemist has recently remarked that there is a future, and a no very distant one either, at which the present notions on the subject will be regarded with as much ridicule as we now regard the attempts of the alchemists of former times to produce gold by a combination and manipulation of the baser metals.

It is scarcely sixty years since chemistry assumed a place among the practical arts, yet its influence upon the commercial interests of the world is already immense. Instances are not unfrequent where important industrial pursuits in one country have been entirely destroyed by the chemical skill and industry of another.

The manufacture of beet sugar, at one time threatened to overturn the industry of the Antilles, and might indeed have succeeded had not taxation come to the aid of the latter. Beet and sorghum sugars, owe their very existence to recent discoveries in the laboratory.

The gas works of Europe have destroyed the monopoly which Egypt once held in the manufacture of sal ammoniac from camels' dung. The chemist has taught us that the refuse of gas manufacture contains this salt in abundance.

Sicily, until recently, derived large revenues from her exports of sulphur to England and France for the manufacture of sulphuric acid. The chemist has now taught the ore smelters of those countries that they can readily and cheaply obtain all they require of this acid from their pyrites and sulphurets.

Europe, within a few years, was lamenting the destruction of the forests of Russia and America, as likely to prove a serious draw back to the manufacture of potash, a rapidly growing necessity. The anxiety on that point was promptly met and allayed by the chemist after some considerable experimenting, who showed that an inexhaustible resource of that description might be found in the refuse of the beet sugar manufacture and salt marshes all over the world.

It is but a very few months since we have witnessed the introduction, upon a commercial scale, of a large series of ordinary articles in domestic use made of a metal, (aluminum or the metal of clay) which is of itself of quite recent discovery, and which until within a few months has been so rare as to be regarded as a valuable curiosity. The present abundance of this metal is purely the result of recent chemical investigations and discovery. It is only since the commencement of the present year that we have heard of the great commercial value of the discovery of a method of obtaining the most brilliant and valuable colors from so unpromising an article as common coal oil and tar, and their application in connection with dyeing and calico printing. An entirely new metal known as "thallium" has quite recently been discovered, for the honor of which discovery, two distinguished chemists are even now contending.

But a very short time ago, a work on practical chemistry would have contained no allusion to aniline or benzole; paraffine, aluminum or thallium. Now these substances, with the exception perhaps of the last, are materials of large manufacture and a work on chemistry which should now be published without treating upon them, would be considered very imperfect. Judging from the past, we may reasonably expect that there are numerous substances now known only in the laboratory which will, ere long, become familiar in the factory.

Our own community is even now agitated with the discussion of what is assumed to be a most important discovery in the way of a flux for smelting copper. We have before us the most indubitable evidence of the discovery of a material, the component parts of which, to be sure, are yet unknown, but which, when employed in a crucible, in a laboratory process, produces the most astonishing results as a flux for separating copper from its ores—effecting with many

varieties of ore, at one operation, the same results which have heretofore required from four to six or eight different smeltings. The announcement of such a discovery, as may well be supposed, is received with many misgivings; yet, with the past before us, we ought not to be surprised at anything, and may be reasonably hopeful, that this present discovery may result in all that is claimed for it.

Chemistry too has no art or industry without giving it an enormous impulse. It seems now a matter of the utmost astonishment how mankind existed without it until the present century. The very progress of civilization seems now completely dependent upon it, and yet, as we have already said, it is but in its infancy. What may we not expect from its future development!

## ERRICKSON AND HIS MONITORS.

Soon after the breaking out of the present rebellion, the Government at Washington learned, from reliable sources, that the rebels were constructing an iron-clad war steamer at Norfolk—the same which subsequently made its appearance as the "Merrimack." It was well known that our navy possessed no ships which could successfully cope with this expected formidable monster. In this exigency, the genius of Errickson was at once called into exercise to devise a match for it. The result of his efforts was the celebrated "Monitor," which, by a most remarkable coincidence, arrived at Fortress Monroe but a few hours, only, after the dreaded Merrimack had made her appearance, and, by her destructive powers, spread consternation through the entire fleet of war ships and transports, in that vicinity. The result of the trial of strength which ensued has already passed into history, as one of the most remarkable naval engagements which has ever taken place, and has had the effect to completely revolutionize the art of naval warfare. Since that time numerous other Monitors, constructed upon precisely the same principles, have been put afloat, and subjected to the severest tests known to modern warfare. From the first, they have never failed to answer their purpose. The problem proposed to be solved by Mr. Errickson was the construction of a vessel, which should present to the enemy the smallest possible target, practically impenetrable, yet which should at the same time be able to throw such a weight of metal as would demolish any antagonist previously existing, or which could be constructed upon any other principle. The success of the effort has been most complete. A greater triumph of engineering skill has never been placed upon record in the world's history.

When the first Monitor was built, 11-inch guns were the heaviest known to the service. Practical artillerymen had no confidence in the possibility of constructing guns of any larger calibre, which could employ, with safety, sufficient powder to give the necessary momentum to the immense weight of their balls, required to make them effective. Capt. Errickson, in the first effort, succeeded in so shattering the Merrimack as to render her unfit for another encounter. But he was not satisfied. He proposed the use of 13 and 15-inch guns, in order to render his work more fully complete and speedy. Admiral Dalgren, chief of the Ordnance Bureau, earnestly remonstrated against the plan as impracticable; but Mr. Errickson, aided by Mr. Fox, the assistant but virtually the head of the Navy department, assumed the full responsibility of arming the monitors with 15-inch guns. The success of this still farther innovation on the previously established rules of engineering has been most triumphantly vindicated in the encounter between the Weekawken and the Atlanta, in which the latter most formidable craft was disabled and captured in fifteen minutes. The capacity of a Monitor to resist blows was most emphatically shown when the Weekawken lay for an hour before Fort Sumpter in the vortex of the most terrible artillery fire ever directed by the hand of man. The Weekawken is armed with two 15-inch guns only, with which she has proved herself to be the most formidable battery ever constructed, and as safe for practical use, as a common field battery. Had the original Monitor been armed with a gun of that caliber, the Merrimack would have gone to the bottom in less than ten minutes after the commencement of her fight.

**INCREASING THE PACIFIC NAVAL FORCE.**—The Government is making every effort for the speedy increase of the Pacific naval force. Fourteen hundred marines are being enlisted at New York city for two years' service on our coast.

## MINING—ANCIENT AND MODERN—IN THE HARTZ MOUNTAINS.

This celebrated Mining Region is a monopoly of the Crown of Hanover, and the shareholders of a mine—the virtual owners of the metal raised—must sell the same to the Government, at a price, which is usually from one fourth to a third below its actual commercial value. These mines contain some of the oldest workings known—dating back 2000 yrs. Ample written records still exist of operations carried on, seven and eight hundred years ago. Evidences of old Roman workings abound, in the frequent unearthing of bronze eagles and busts, known to have originated with that ancient people—mementoes that have come down to the present age from an era of civilization between which and ours has existed a night of ten centuries, during which the light of civilization and of arts had nigh become totally extinguished. The associations that cluster around these ancient workings are most strange and interesting, and bring forcibly to mind the Bible description of mining in the days of the ancient Jewish prophets. In these mountains are individual mines whose earliest workings date back five hundred years ago, and which still yield a plentiful supply of ore.

The location of the Hartz Mountains is quite isolated, and neither the people nor the general face of the country have undergone any material changes or modifications for centuries. Modern engineering science and the late improvements in mining machinery and smelting operations find very little favor with this peculiar people. Even the more enlightened classes, and those who fully appreciate modern improvements, are not in favor of any change in this particular case, from the fact that ample compensation therefor is supposed to be derived from the greater availability of labor among a people so stolid that not even the rush of the iron steed would avail to awaken them from their Rip-Van Winkle sleep of ages. Even the steam engine, that most powerful and effective of all modern appliances for the drainage of mines, and other purposes in that connection, is viewed with disfavor by this people, and, in a stubborn adherence to old usages, miles of tunnels are run at an incredible amount of labor to gain a few feet of drainage, when by a mere moiety of the expense, the same object and more, could be gained quite as effectually by pumping.

In no part of the world could steam be applied for drainage more effectually than here. The water does not flow into these mines from springs, even when carried to a very great depth, but enters by infiltration merely, and consequently at a very slow rate. The most wonderful and laborious excavations, in the way of adits for drainage, to be found in the world, exist in these mountains.

In the more ancient workings, the excavations appear to have been carried on with very little engineering skill, and consequently are very irregularly driven. Some of the ancient shafts reach to an enormous depth, and excite the utmost wonder as to the means employed in sinking them without the aid of gun-powder. That important modern invention is almost the only improvement over the ancient mode of working which has yet been introduced into these mines. The skill with which the older workings are secured, however, is a matter of admiration, even to the modern engineer.

These mountains contain almost all the minerals but coal, gold, silver, copper, lead and iron abound. The gold is found, as in this country, in veins of quartz, intermingled in various proportions with small quantities of the baser metals as in California. Auriferous pyrites occur in considerable quantity. The gold is occasionally visible to the naked eye, but not nearly as generally as here. Argentiferous copper abounds, but the silver which it contains is secured by a very laborious and expensive process. Silver ore is obtained here in considerable quantities, and is smelted by both the hot and cold blast.

**HORRORS OF WAR—LOSS OF LIFE.**—The present War of Rebellion, in this country, has been sanguinary enough to fill the whole land with mourning, and yet there have been wars far more destructive of life. It appears from the best historical testimony, that of one million two hundred thousand men enrolled in the armies of France in 1813, only 100,000 were alive in 1814, and that the loss of the Allied Powers in the wars with Napoleon was, according to the *London Times*, not less than, "ten million of men in the prime of life." France, in the same period, lost about six million.

## THE MINING SHARE MARKET.

The Mining Share Market, for the week just passed, has been exceedingly dull, in part owing to the general apathy which has prevailed for several previous weeks, but in a great measure in consequence of the general State Election in which this city has taken an unusual interest.

Burning Moscow, North American, Daney, Baltimore American and Sheba, have been largely dealt in. The two former at advancing rates and the three latter at a slight decline.

Ophir shares have declined somewhat in consequence of pretty definite information that the forthcoming dividend will not be increased.

Gould and Curry has advanced \$100 per foot.

Potosi has advanced to \$1,000, with fair demand.

Sierra Nevada, closed at \$90, a decline of about \$10.

Daney shares have met with a material decline, with large transactions. The decline is attributable to anticipated heavy assessments.

Belcher has been less dealt in than last week, but at somewhat improved rates.

Burning Moscow has met with a fair business at an advance of about \$20 per foot, but attended with considerable fluctuation.

Overman is still improving and closed at a large advance over last weeks figures.

Yellow Jacket closed at a slight depreciation from last weeks figures, having been in fair demand.

Wide West Shares have been sought after, and easily bought at \$115.

Real del Monte, is in favor with a few and has been sold at \$400; but little stock offered.

Utah, dull at \$5; Pond, at \$35; Falls of Clyde, \$5.

Sheba, Humboldt, has been more offered, and declined to \$120, after selling at \$160.

Uncle Sam, Gold Hill, fluctuating from \$82 to \$190, and closed at \$95, with a weak Market.

De Soto, but little enquired for.

We subjoin the principal sales of the week.

## COPPER.

While holders of good copper stocks, such as represent mines already shipping ore in quantity, or those which are in a forward state of development, are firm in their prices, the stock of undeveloped mines are a drug in the market, and can with difficulty be sold at any price. But little

of the former is being offered; the impression being that stock in such mines is quite underrated in the market. The returns from foreign shipments which will soon begin to come in for various mines, but recently opened, and the result of the operations of the Smelting Works at Antioch, which will be heard from in the course of the present month, will, no doubt, soon exert an important influence upon copper stocks.

Considerable interest is being manifested in this new branch of California mining, in Eastern cities, particularly in Boston, where the press is devoting special attention to the subject. The large amount of ore already going forward and the encouraging prospects for the future give the earnest of early and full return freights, from this port. This important feature is being duly appreciated by our friends at the East.

A sale of a claim in the Lancha Plana Company, is reported the past week, as having taken place in Stockton, at 6,000 (claim 300 feet.) The Keystone is held in that market at \$130, with but a limited supply offered.

Reports from the Northern counties state that the location of copper claims is still going on as much as ever. The work of development is also progressing. The Union Company are taking out ore in considerable quantities, and preparing it for shipping. They will not send any forward until they have about 100 tons, as they intend to ship it to the East themselves. They have a considerable amount now ready for shipment.

There are as many as a dozen mines in Klamath and Humboldt counties that expect to be ready to ship ore very soon.

The Well Lead, in Nevada county are taking out large quantities of ore. They are sending the inferior qualities only to the smelting works at Antioch. They retain their first class ore at the mine for shipment to the East. They have a contract for the delivery of 1,000 tons of low grade ores.

The Last Chance has considerable rock out and will soon commence shipping.

The Burra Burra mine, two and one half miles south from the Well Lead, has a shaft down fifty-one feet with good indications—also a 14 foot drift. They have in the shaft a fine chimney, of small dimensions, but gradually opening out, of black oxide, from which some 150 lbs. have already been taken. The same presents a most promising indication of a strong lead of sulphurets, which they will doubtless strike soon.

## CURRENT OF THE NIAGARA FALLS.

The immense force of the current in Niagara river, near the suspension bridge, is strikingly illustrated by one or two facts related by a gentleman who attempted to sound the river at that point. We may remark here that the current is so strong that the river cannot be sounded at that point, and probably never will. The attempt referred to was made with an iron of about ten pounds weight, and attached to a No. 11 wire, all freely suspended, so as not to impede the fall of the weight. The experimenter says: "I let the weight fall from the bridge, at the height of two hundred and twenty-five feet. It struck the surface fairly, with the point down, and must have sunk to some depth, but was no longer out of sight than a second, when it made its appearance again on surface, about one hundred feet down the stream, and skipped along like a chip until it was checked by the wire. We then commenced hauling in slowly, which made the iron bounce like a ball, when a cake of ice struck it and ended our sport. I am satisfied that no metal has sufficient specific gravity to pierce that current, even with a momentum acquired by a fall of two hundred and twenty-five feet. The velocity of the iron, when striking, must have been equal to one hundred and twenty-four feet per second, and consequently its momentum was near five thousand pounds. Its surface opposed to the current was fifty superficial inches. This will give an idea of the strength of that current, and at the same time hint at the Titan forces that have been at work

## REESE RIVER MINES.

Reports of a most favorable character continue to reach us from the Reese River Mines. Probably no section of our widely extended mining region is attracting so much attention at the present time as this.

Some idea of the rush to this region may be formed from the following item clipped from the Reese River correspondence of a city contemporary, writing under date of Aug. 17, 1863:—

Of the countless number of gold and silver mines supposed to exist, not yet discovered, in that vast region of country comprised between the Rocky Mountains and the Pacific, few regions or districts seem to be attracting so much attention and causing such excitement as that of Reese River, the mining headquarters of which is Austin. One of the great troubles here seems to be the want of additional stage facilities to accommodate the rush of persons coming to this country. Notwithstanding that the Overland Mail Company, which employs over 200 stages and innumerable horses and mules, on a line 1,915 miles in length, running directly through this town, where they land from six to twelve passengers daily, there is seldom a day when the stages leave Virginia City at there are not from three to six passengers left behind. To secure a passage on any particular day, it is necessary to register one's name three or four days in advance.

Eleven four-ox teams laden with machinery for Reese River, passed through Dayton August 27.

The Virginia City *Enterprise* of August 23d contains the following item:—

There is on exhibition at Lewis & Spaulding's saloon, under the International Hotel, twenty specimen bricks of bullion from the Reese River mines, produced from the following claims: From three tons of the Florida claim, from unassorted rock, \$2,573; from ten tons of the Morgan & Murry claim, unassorted rock, \$3,181 40, from two tons of the North Star rock, unassorted, \$554. The above rock was worked through the mill of Messrs. Buel & Co., at Austin. Two more mills will be in operation in Austin, in about a week.

The *Farmer* of this city, of Saturday last, says that a quantity of ore recently brought down from the Dacotah Ledge, a-sayed by G. W. Bell, yielded \$4,991 50 to the ton.

A recent crushing of two and a half tons of rock from the North Star ledge, at Buell's Mill, in Austin, yielded \$500. The crushing of 2½ tons from the Florida ledge at the same mill yielded \$1980.

## 50 lbs. MARINE and Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

## DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

## 25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire-Proof, and costing less than any paint.

## DIRECTIONS:

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.  
ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.  
S. C. BRADSHAW, Agt.,  
G. T. Forquz, Superintendent.

WORKS, North Beach; Office, 509 Sacramento st., San Francisco.

## GENERAL NOTICES.

DR. H. AUSTIN,  
DENTIST,

No. 634 Washington street,

Between Montgomery and Kearny, (over San Francisco Baths.)

I have recently received from London a New and Beautiful Vulcanite (India Rubber) for Artificial Teeth, which is far superior to any other ever used. It is light, clean and durable, and of a natural color. The cheapest and best material for temporary (and in many cases) permanent sets. All operations thoroughly performed, and at reasonable prices. je-29

**DESKS**

## New Patent Agency.

WE HAVE CONNECTED WITH THE  
Publication of the "Mining and Scientific Press"

## The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

Mining and Scientific Press Agency  
the most desirable place to make application for Letters Patent on the Pacific coast. Apply at  
Office of the "Mining and Scientific Press," Room No. 57, Government House, corner of Washington and Sansome streets, San Francisco. EWER & SMITH.

## FOREIGN PATENTS OBTAINED

By application at this office, Room 27, Government House. EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 57, Government House. Terms moderate. EWER & SMITH.

## PATENT RIGHTS.

Patent Rights Bought and Sold,  
At the office of the "Mining and Scientific Press" Agency  
EWER & SMITH.

## IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors. EWER & SMITH.

## Offices To Let,

In the Government House, Corner of Washington and Sansome Streets. Two large suits of Offices, the most commodious and accessible in the city. C. A. CRANE, Proprietor

## GENERAL NOTICES.

## HAYNES &amp; LAWTON,

SAN FRANCISCO.

## WHEELER'S Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans have been in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 2016-1f ZENAS WHEELER.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

Staple and Fancy Dry Goods,  
CARPETS, DUCK, ETC.,

Cor. Front and Sacramento streets,  
SAN FRANCISCO.

JOHN WRIGHT, 511 Market street, Opposite Battery, San Francisco.

**CALIFORNIA TOOL WORKS!** John Weichhart, Manufacturer of All Kinds of Edge Tools, Etc., Plane Irons Moulding Irons, Stone Cutter's Tools, etc No. 22 Fremont street, bet Market and Mission, San Francisco, July 14, 1863. jy 20

A PARISIAN inventor has off red to the Polish Committee a new sort of fulminant, which will explode after being an hour under water. These bombs can be made in the midst of the woods, with ordinary materials, and at low price, and it is said that many persons might be injured by a single discharge.

A New London man has invented a weapon that may be inserted in the handle of a lady's parasol, and will drive a ball through an inch and a half plank at the distance of ten rods.

A BRITISH officer has invented a new rifle ball, charged with solid phosphorus.—When lodged in any object it burns with great fierceness for some time.

ANOTHER FALL AT NIAGARA.—The St. Catherine's Journal says that on Saturday night, the 18th of July, with a sound louder than the discharge of a park of artillery, a large section of the rock on the north Canada side of Niagara Falls, near Mr. Davis's Table Rock Hotel, fell into the yawning abyss below, giving the Falls on that side a more decided horse-shoe appearance than they had before.

**Eye, Ear and Throat.** DR. DE CASTRO, Oculist and Aurist,

WHO HAS PRACTISED IN NEW York and all the principal cities of Europe, with such unrivalled success, and from each place in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. Deafness of long standing thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**Self-adjusting Artificial Tympanum,**

For the relief of deafness, attended by loss or injury to the membrana tympani, and for the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc. The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November, 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state; the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

Mr. Editor—Having been afflicted with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent one operation, and it is with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist. JOHN REESE, Napa Valley.

James Callaghan, witness. San Francisco, July 30th, 1863.

[From the Daily Alta.] San Francisco, June 30th., 1863.

ED'S DAILY ALTA: Permit me through your widely circulated journal, to say, that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearny and Market Streets, and undergoing under his direction, two operations, she has heard sounds very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physicians and aurists in California, but up to the period of visiting Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT, 812 Green Street.

**APARTMENTS.**

FURNISHED APARTMENTS, WITH, OR WITHOUT Board, at 1018 Powell Street, between Clay and Washington street. Persons desirous of a respectable home will do well to apply. jy6

Certificate for Ten Shares, No. 33, dated July  
8th., 1863, of Tamplias Gold and Silver Mining Company.  
The finder will be suitably rewarded by leaving it in  
room 24, Government Block.

LOUIS EDWARDS.

**MINING & SCIENTIFIC PRESS.**

**THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.**

**THIRD YEAR! VOLUME VI.—NEW SERIES**

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits together with several original engravings of new inventions, etc., prepared expressly for its columns. This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

**The Mining Interest!**

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to the purpose, and of everything generally that may be of service to the Miner.

**The Inventor!**

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patent with dispatch.

**The Mechanic and Manufacturer!**

Will be greatly benefitted by its personal, as its columns will from time to time contain original engravings of new machines and inventions, together with large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

**To Chemists, Architects and Millwrights!**  
This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

### Terms.

To mail subscribers—Four Dollars per annum  
**Club Rates.**  
Five Copies for Six Months, \$26.  
Ten Copies for Six Months, \$46.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.  
For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to many parts of the country.  
**EVER & SMITH, Publishers,**  
Room 67, Government House, Corner of Washington and Sansome streets, San Francisco.

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, SEPTEMBER 14, 1863. NO. 46.

## REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

## DEODORIZING COAL OIL.

A Patent has been taken out by a London chemist for a method of removing the offensive odor from coal oils. This desirable object is effected by means of nitrous acid in combination with shreds of iron, and the gas so formed is caused to pass into the bottom of any vessel containing petroleum, until the entire mass is completely saturated, when the vessel containing the oil is closed, until, by testing, the samples are found to be free from any offensive odor. This deodorizing process is also capable of being applied to the oil in connection with the process of distillation; so that the oil may be introduced directly from its crude state into an engine or boiler. The invention is a very important one, and the universal application of its use must render its use universal in the manufacture of coal oils.

**DIRECTIONS FOR USING KEROSENE LAMPS.**—The Board of Health of Brussels give the following, among other directions, about the proper care and mode of using kerosene or petroleum lamps:

"The lamp should always be kept hermetically closed, for whenever there is an opening that admits a direct communication between the oil-holding receptacle and the flame the lamp ought not to be used, as an explosion may ensue. The receptacle may contain more petroleum than is sufficient for one burning, and should be made of glass or other transparent material, so that the quantity of liquid in it may be easily ascertained. The foot of the lamp ought to be broad and heavily weighted, so as to give it greater stability, and prevent its being easily upset. Care should be taken, before lighting the lamp, to see that there is a sufficiency of petroleum in the receptacle, and should it, nevertheless, be consumed earlier than expected or required, the flame must be first extinguished, and time allowed for the lamp to cool, before refilling and lighting it again.

**GOLD POCKET.**—The Pacific Company at Grass Valley, have struck a pocket in their quartz lead of almost pure gold on Monday August 28th, from which about \$17,000 were taken in a few hours. The gold was clean enough to take to town at once, without going through the ordinary process.

**A REGULAR EXPRESS** has been started between Aurora City and Owen's River. It must prove of great convenience to parties at either end of the route.

**HUMBOLDT SALT.**—The salt company's workmen have come upon a bed of salt, in the marsh, white as any table salt, and particles, crushed in the fingers, crumbling out as fine. It requires no grinding.

## THE BEAUTIFUL SKY.

It is strange how little people in general think or know about the beautiful sky over their heads. It is the part of creation in which Nature has done more to please and benefit man than in all things else. In no other work do we see the hand of a great and all-wise Creator so unmistakably displayed. The beautiful sky seems to be spread out like a great book in which man, in all conditions, whether civilized or savage, may read, as in letters of fire, "the hand that made it is Divine." In no other work of God is the beautiful and useful so intimately blended. The great essential purpose of the sky might have been accomplished by the sudden condensation of a great black rain cloud, once a week or so, which might have been emptied of its waters for irrigating purposes, and then a blank colorless waste have continued until the next fall of water was needed. But not so did the Almighty purpose when he made the firmament, and "divided the waters which were under the firmament from the waters which were above the firmament." Instead of such dreary monotony there is not a moment of time in which the great book over our heads is not changing its face. Page after page passes before us, beauty after beauty, picture after picture sweeps across the sky in a never ending series of exquisite glory—the Creator talking to his creature, teaching him to look up from the groveling scenes of earth, and to read in the beautiful sky the lesson of immortality and life beyond the grave!

The reason why, in a clear atmosphere, the sky is blue, is thus philosophically accounted for:

The white light of the sun falls upon the earth without change; it is then reflected back by the earth, and as it passes through the atmosphere portions of it are returned, and this double reflection produces a polarized condition of light, which imparts to the vision the sensation of a delicate blue. What is meant by polarized light is, that light which has been subject to a compound refraction, and which, after polarization, exhibits a new series of phenomena, differing materially from those that pertain to the primary conditions of light.

**AMERICAN MECHANICS IN FRANCE.**—One of the most extensive India Rubber Factories in France is located about three hours ride from Paris: was built by the father of Louis Philippe and employs from 600 to 700 hands. The establishment is now owned by a corporation. The most interesting (to Americans) circumstance connected with it is the fact that three American mechanics hold the chief places of superintendency in this great French Institution. This is a fact which speaks eloquently in favor of the superior mechanical skill of our countrymen.

**MARS LIKE THE EARTH.**—Recent examinations of the planet Mars, show it to be very similar to our globe. Snow is seen at both poles, the white circle increasing in winter and decreasing in summer. A greenish belt, with bay and inlets, is at the equator, supposed to be a sea and a redish island in that sea has been detected. The heat and light of the sun are only half what they are on the globe; but this may be compensated by a difference of atmosphere in their favor. The gradual appearance and disappearance of snow would seem to favor that idea.

## RICH QUARTZ IN CARIBOO.

The steamer Brother Jonathan which arrived from Victoria on Monday brought down a large amount of treasure and most encouraging reports with regard to the yield of the mines in Cariboo. The amount of gold dust by this arrival is about \$440,000, 135,000 of which was from Oregon. About \$200,000 of this amount belonged to three miners from Cariboo. These men employed last year about 20 men in opening their mine, and began to take out gold in January last, taking out in a single day as high as 108 pounds, but averaging per day 100 ounces. They deposited their treasure in the Mint.

The reports from Cariboo are very interesting. Much excitement had been caused by the discovery of rich auriferous quartz veins. A correspondent of the British Colonist, says on this subject:

Within the last few days some very promising veins of rich quartz have been discovered. All of these discoveries though undoubtedly rich and extensive have been almost totally eclipsed by a discovery made yesterday. Joseph Pearce, an Englishman, lost some of the horses of his pack train about two days ago. While searching for them, he found a vein of white quartz, about two miles from Richfield. He worked at the vein for two days, cleaning off the moss and vegetable mould, and the result of his labor was the discovery of one of the richest lodes of quartz that has ever been seen. The specimens taken from the ledge are studded with gold and silver, and the usual concomitant, iron pyrites.

As might well be expected, this discovery caused considerable excitement, and has led to quite a rage for quartz prospecting. Several other ledges, of supposed value have been taken up. This, like all such enormously rich discoveries, is probably nothing more than a "pocket," which will soon be worked out, and leave the balance of the vein, perhaps below paying value. Such extraordinary rich deposits of gold, are never very extensive. A discovery equally as rich, or more so, was made in Oregon some three or four years ago, which created a great furor at the time, but which was soon forgotten. A Cariboo correspondent of the Victoria Chronicle, after admitting the possible richness of this discovery, says;—

"If nothing further of importance is 'struck' in Cariboo in the next month or two than is now known, I think that the population of the country will be less than it is at present; the trade of the country will be less, and merchants generally will feel that times are dull and hard."

**THE "LIMA."**—The claims of the Lima company are situated two hundred feet in the rear of the Chollar works. The ledge is a good one, is sixty feet wide, and on the "Comstock range"—three very good points in this country. It was located two years ago, by Billy Chollar himself. The company are sinking a shaft on it, which has now reached a depth of 170 feet. The stock, which is nearly all owned in San Francisco, has never been thrown upon the market. As the Lima is beginning to excite some attention here, we shall probably hear of it oftener in future.

The Shera company, contemplates expending about \$150,000, in ascertaining more definitely the contents of their mine and the shape in which it lies.

## THE REESE RIVER MINES.

The Reese River *Reville*, in speaking of the Mines there says: "Just think of it—more than 100 ledges already known in this one district which will pay, and pay largely—from \$150 to \$1,000 per ton. The stuff is universal—all around in the most unpromising ledges and out of the way places. This is the country for poor men; any sort of a claim from one inch to twenty feet in width will furnish pay ore right from the surface—will pay its own expenses and those of all connected with it, if worked. What more could be asked? Rich is no name for it; the country is positively "seedy" with it, and all available. But it is not proper for us to brag; we only ask skeptics to call and see for themselves, like all sensible men are doing."

The same paper in speaking of what the mills are now doing in that region, says:

Brooks is now crushing; his mill appears to work to perfection. The Pioneer Mill and Mining Company have obtained a site for their extensive mill in the canon below town, and have a number of men engaged in grading and preparing the foundation. Their machinery, timbers, etc., will arrive here in a short time. The Union Mill Company, just above, have received all their machinery, and are putting the mill together at a rapid rate. They will be under way in ten days. Hildreth & Co. are making good headway, considering the staunch manner in which they are doing things. Buel & Co.'s mill is busy pretty nearly all the time. The Oregon Mill Company have a large foundation up and are rushing things along.

One and a half tons of ore from the Union No. 2, worked at Buel & Co.'s mill, yielded \$450, or \$300 per ton in silver. The body of ore from which this lot was taken is not less than six feet wide, and increasing rapidly in breadth.

San Miguel rock, worked at Buel & Co.'s mill, yielded \$114 from 480 pounds of quartz—silver, 981 fine, with gold \$1 44 per ounce. This would be about \$475 to the ton.

F. Davis's water power arastra mill at Cañon City has been crushing the common rock taken from the Harding & Dickman ledge at Austin, which yielded 38 pounds of bullion to two tons of rock, or \$392 per ton. The next batch of rock to be worked will be from the Josephine, at Big Creek, which has worked \$518 to the ton. Dwier, McConnell & Co. are talking of establishing a mill at Cañon City. A mill has been commenced below, at Lander City.

Ten pounds, less three ounces, of Yankee Blade rock, first location, crushed in an iron mortar in Gardiner & Clough's office, yielded 9½ pounds of hard amalgam, which, retorted, gave 18½ ounces of silver, worth \$1 25 per ounce.

Oregon, Seymour, Blue, Washington, Magnolia and Florida, Manhattan, Ethan Allen, and a number of other claims above town, are taking out large quantities of rich pay ore. There seems to be no lack of quartz now ready to run almost any number of mills.

The success which has so generally attended the crushings thus far attempted seems to have inspired the miners everywhere throughout that region with renewed energy to apply themselves vigorously in the development of their claims. We condense from the *Reville*:

Work is progressing on a number of claims. Virginia tunnel will strike the ledge within 100 feet; Florence will run night and day very soon.

The developments in Union No. 2 are so important as to have a perceptible effect upon our whole mining district and the public abroad. On the surface it was not over a foot wide, but at a depth of 20 feet, where the shaft struck it, there is a solid vein of quartz 6 feet wide and an irregular formation of quartz for 6 feet more. The first 6 feet of quartz abounds in the purest oxide and chloride of silver, with other forms which make up the noted Mexican "Peacock ore," so very valuable.

One mile south of town, in the vicinity of the Union No. 2, is the Congress, one of the older locations and on which considerable work has been done. The shaft is now down 30 feet, where it has passed through the quartz lode, developing a choice quality of ore.

The Marshall company have several tons of choice ore sacked ready for crushing. They have the ledge opened in two places some distance apart, exposing a good sized lode of the utmost purity and value.

Springer and Ellis lose no time in the development of the San Domingo, in Springer Cañon. They have a shaft and incline down 30 feet, with a tunnel from near the bottom some 25 feet in. This mine, like all others southwest of town, contains the bromide ore in great purity and abundance. They have 10 or 12 tons out and ready for the mill.

Below this and toward the plain is the Miguel, a Spanish discovery of undoubted importance. An incline has been put down on it 30 feet and the ledge taken out of this distance. It is the right kind of rock and is well defined and improving.

The Vernon Ledge, Smokey Valley, is now showing very rich silver ore. An assay from the top gave \$2,329. Workmen are tunneling in on the vein, and find the pay streak at least two feet wide—increasing.

Maggie Ledge, near Yankee Blade, is a new and valuable

discovery, the rock being of a pure sulphide quality, and so rich at the surface that it has all been sacked up. Workmen are now down six feet with the shaft, but water has come in too strong to continue the effort to sink it. Hence a tunnel will be run immediately to tap the lode deep enough down to drain it thoroughly.

Die Vernon—This ledge, at a distance of not more than 12 feet deep, has been struck over eight feet thick, and this within gun-shot of the centre of Austin.

Queen Brady is the name of a ledge north of the town, supposed to be the same as the Sonoma. It is undoubtedly rich, as globules of silver appear all over the roasted or burnt rock.

The miners at Cortes District are busily engaged taking out very choice rock, quite similar to the rich ores of this vicinity. Andrew Veatch is away beyond, north, exploring the country and risking his life as usual.

## THE NEW STEAMSHIP "GOLDEN CITY."

The Pacific Mail Steamship Company is fast putting afloat a large and powerful fleet of first class steamers for this coast. The last of this fleet launched is the "Queen City," now on her way hither. The model of this vessel is much like that of the Constitution, but somewhat improved as to her sailing qualities. She is about the size of the Constitution, with engine driven by the same size of cylinder—105 inches diameter and 12 foot stroke. Her paddle wheels are 30 feet in diameter, capable of making 17½ revolutions per minute. She is built with water-tight bulkheads, fore and aft, dividing her into three compartments and is provided with 14 life-boats; has 56 splendidly furnished double state rooms, and in every respect the vessel is superbly fitted up and admirably adapted to the Pacific coast.

THE SARAH FRANCIS Gold and Silver Mining Company has been recently incorporated for the purpose of mining and milling, and buying and selling mining claims.

They own and have title to two claims in Webster district, Alameda county, of 1600 feet each, besides 50 feet in the Avalanche, 40 feet in Saturn and Venus, 60 feet in the Champion lode, White Cloud Co., 5 feet in the Good Hope, 10 feet in the Pride of the West, 10 feet in the Henry Clay, 10 feet in Wood Chopper, 80 feet in the Glengary and 75 in the Gould and Hale, in all of which the work of tunneling is progressing.

It would seem from the number of claims which they are developing in the Webster, Alpine and Mogul districts, that they must certainly meet with success, as they are not confined, in their operations, to the result of labor on any one claim. One share of stock in the above named company represents a corresponding interest in all the interest of the company in the above mentioned claims.

MINING SOUTH:—A Los Angeles correspondent of the Sacramento Union, writing August 25th, says that "300 ounces of gold had just come in from the new placers, and that the excitement in that city still continued." Three hundred ounces, one would suppose to be a small arrival to be considered worth reporting from a locality of such extraordinary reputed richness. All efforts to get up a large tide of emigration in that direction have thus far failed. It will be quite soon enough for such a movement when important arrivals of gold from that region are reported.

The same correspondent reports the arrival at Los Angeles of a large quantity of rock from the Slate Range district, from the Antrim and Comet lodes, which is enroute for San Francisco, and is said to be the richest rock yet brought from that district, yielding in silver over ten thousand dollars to the ton.

PROF. WHITNEY, who has been spending a short time in this city, has again gone to the mountains, in the prosecution of his geological labors. The rumor of his resignation, as State Geologist, and acceptance of the Superintendency of the Latrobe Tunnel, at Virginia City, is without foundation. It probably grew out of the fact that Professor Blake, formerly connected with the Geological Department of the Pacific Railroad Survey, has accepted that position. The Latrobe Tunnel is one of the heaviest and most important enterprises of that kind ever undertaken in the State.

WINE, NOT MINES.—Our compositor, last week, made us give Mr. Hittell credit for a very valuable article on the Mines of California. Mr. H. has written many valuable articles on the great leading industry of our State, but the article to which we alluded, and which was published in the last *Pacific Monthly*, was upon the Wines, not the Mines of California. Mr. H. appears to be a good judge of both,

## OWEN'S RIVER.

Considerable attention is being directed at the present time to the Owen's River country, to the south of Carson City. The Owen's River flows through one of the most delightful valleys on the Eastern Slope of the Sierra Nevada. The valley is about 140 miles long with an average width of about 10 miles. It is not considered mineral and has been brought under government survey and sectionalized. It is found to contain 592,040 acres, 200,000 of which is very superior agricultural land. Owen's River takes its rise in Mono County, about 40 miles south-west from Aurora. The upper banks of this river contain an immense amount of the finest timber in the world, which will soon become very valuable as a source of supply for the extensive agricultural interest which is soon to grow up in the valley, as well as for the mines which are located along the base of the Inyo mountains throughout its entire eastern border. At the southern extremity of the Valley is Owen's Lake, a beautiful sheet of water into which the river empties. This lake is about 20 miles long by 18 broad. The river, with slight improvements, may be made navigable for a small class of steamboats, at all stages of water, throughout the entire length of the Valley, and with the Lake affords a most admirable chain of intercommunication from one extreme of the Valley to the other. This Valley is from 4000 to 6000 feet below the summit of the Sierras, possesses a fine climate and is fast filling up with agriculturalists. The new comers express themselves as well pleased with the country, and with the mining prospects around them, to which they look for a market for their produce. Vegetables of every kind can be raised in great abundance, as well as the cereals. No further trouble is apprehended from the Indians, nearly all of whom have been removed to the Tejon Reservation. Portions of the Valley are covered, at the present time, with most luxuriant crops of red-top clover, herds grass, etc., and the natural productions of the soil.

The most northern mining district, we believe, is the Inyo, in which about 1300 claims have already been recorded. The *Times*, published at Aurora, in its issue of Sept. 5th, speaking of this district, says:—

"Capt. Peck of San Francisco is about to commence the erection of two furnaces; one for the Hooker company and one for the Burnside company, which are designed to smelt the ores of these companies. [Argentiferous lead or—Ed. Press.] Mr. Wingard has recently gone to San Francisco from Owen's River, and will forward forthwith machinery for a mill via Aurora. The San Carlos company will soon have their mill under way. This mill is driven by water power. Capt. Bosworth has arrived from San Francisco and commenced crushing the Union company's rock. The company has out at least five hundred tons of rock. [A friend at our elbow says 1500 tons would be nearer the truth. Ed. Press.] Their ledge is from eight to twelve feet wide, containing large quantities of gold and silver, the former predominant."

The Ida company are taking out fine rock; their ledge called the Nevada. De Bend City is the most central position and is improving very rapidly. The buildings are principally made of adobes. The town has been recently surveyed; the streets are 100 feet wide, crossing each other right angles. The blocks are 300 by 220, having an alley each of twenty feet. Many families from Sacramento, Virginia and southern counties are coming to the valley, and set to be pleased with their new home. San Francisco is already sending her share of settlers."

The Visalia *Delta* of a late date, in referring to this region, says:—

"A Steady stream of navigation is pouring into the Owen's river valley. The abundance of water power, in close proximity to the quartz leads, renders this the most desirable location we know of for miners. The farming land is being rapidly taken up, and in less than a year we look to see an industrious population of thousands settled there."

SAN BRUNO G. & S. M. Co.—The claim of this company is located near Silver City, and includes 1400 feet of ground. A shaft has been sunk to the depth of 80 feet and a ledge opened over sixty feet in width, of good pay rock. The company are about incorporating. The Devil's gate District will eventually be one of the best mining districts in the Territory.

THE EMPIRE COMPANY, is located at Santa Cruz. I seen a letter from a reliable gentleman, formerly a broker in this city, in which the mine of this company, is very favorably spoken of. They have an inexhaustible amount of rock easily attainable, which is estimated to be worth from \$1 to \$40 per ton.

# ASSAYS!

**Promptness and Accuracy Secured**  
By the Use of the Most Improved  
METHODS OF  
ANALYSIS!

**Advantageous Terms for Prospector's Clubs**  
and Mining Companies.

Assaying, also in Mineralogy and Chemistry as far as re-  
quired to become a practical Assayer.

# BAUNCHEIDTISM,

THE PRESERVER AND PRODUCER OF LIFE.

THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF  
curing disease, is a "fait accompli" in medicine,  
and needs no more proof. The public has crowned Bunc-  
heidtism already with an extraordinary patronage, and it  
is acknowledged by all men of science that BAUN-  
CHIDTISM is founded on a rational, scientific basis.

It can safely, and with sure success be applied to pa-  
ralysis in consequence of Apoplexy, Palsy and Rheu-  
matism of every description, which kind of complaints  
can find their only relief by the above method.

Especially can it be applied successfully, in the spring  
of the year to diseases of the eye.

Dr. Borchers is the only doctor in California who has  
the original series of Dr. BAUNCHEIDT and his original  
oil. Dr. Borchers is also in possession of original letters  
of the inventor of the method by which he can prove  
that he is perfect master of the latter.

DR. J. C. BORCHERS.

**New Style of Ladies' Buckle!**

**W. BOHM,**

INVENTOR AND PATENTEE.

THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the  
construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
possesses several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
It excels all other buckles in

**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine  
this Buckle at the Jewelry Establishment of

BEAVERMAN & LEVY,

621 Washington Street, San Francisco.

JOSEPH, BROTHERS,

607 Montgomery Street, San Francisco.

FLOBERG & CONRAD,

118 F Street, Sacramento.

Agents for the Patentee.

Every Buckle sold, stamped "W. Bohm," will be  
guaranteed as to its Strength and Durability.

W. BOHM, Patentee.

# THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of  
the most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

**ALONE STANDING THE TEST.**

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

**METHOD OF CRUSHING ORE.**

THE BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

**EXCLUSIVELY ADOPTED**

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

**EFFECTIVE, SUBSTANTIAL AND RELIABLE.**

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

**BOTH WET AND DRY CRUSHING,**

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1850, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,

John D. Winters & Co., Esmeralda,

Crown Point Co., Gold Hill,

Potosi Mining Co., Virginia City,

Tajo Mining Co., Mexico,

Sheba Mining Co., Humboldt.

TAY, BROOKS & BACKUS.

**BRASS FOUNDRY.**—Among the many useful  
and importance mechanical establishments in  
this city, that of Messrs. W. T. & J. Garratt,  
Brass and Bell Founders is deserving of spe-  
cial notice. Without disparaging other firms,  
we would remark, that, so far as our observa-  
tion has extended, these gentlemen are at the  
head of their business in this city. They are  
prepared to execute every variety of orders in  
their line from a brass knob up to a church  
bell. Their establishment is complete in all  
its branches, and we would gladly recommend  
them to the consideration of our friends gen-  
erally.

**Mr. G. Moore,** of 612 Sacramento street, of-  
fers favorable opportunities to those wishing  
assays of ores, mineral waters and guanos.  
The references to his card, in our columns,  
speak for themselves. Mr. Moore stands high  
as a chemist, and his charges are reasonable.

**Mons. F. A. Devierey.**—We had the pleas-  
ure of inspecting the establishment of this ac-  
complished artist last week. We can speak  
in the highest terms of his skill as a lapidary.  
We also saw some splendid specimens of his  
own manufactured jewelry. We beg to re-  
commend him to our friends. His place of  
of business is at 437 Pine street.

**Messrs. Riehn, Hemme & Co.!** These well  
known scientific gentlemen are now in busi-  
ness as assayers. They have a splendid la-  
boratory on Summer street. Mr. Riehn, from  
his official connexion with the United States  
Mint, is too well known in our community to  
need praise from us. All business intrusted  
to them will certainly be executed with effi-  
ciency and dispatch. Their office is on Mont-  
gomery street, opposite Wells, Fargo & Co's.

**G. E. MORE,**

**Assayer and Analytical Chemist,**

P. M. S. Co's. Office, also T. Boyce.

## DOWN IN A COPPER MINE.

During our recent visit to Copperopolis we took occasion to look into the interior of the famous Keystone Mine. The Keystone is the first Northern extension of the Union Mine, the most productive and probably the most valuable copper mine in the world. It was upon ground now belonging to this Company where the first copper, upon the great Copperopolis lead was originally struck, and one of the main shafts of this mine has been named "The Discovery Shaft," in commemoration of that fact. The Keystone is probably the most thoroughly developed copper mine in the State. It has been worked about two years, in which time over 1,000 tons of No. 1 ore have been shipped; 10,000 tons of No. 2, raised to the surface and ready for concentration, and from 12,000 to 15,000 tons of No. 2, uncovered in the mine and all ready to be taken out with the expenditure of a very small amount of labor. The present rate of shipment is not far from 200 tons of No. 1 ore per month.

The immense piles of ore and waste dirt heaped up about the main shaft of this mine gives the visitor some idea of the vast cavernous openings made below. Not satisfied, however, with this "evidence of things not seen," on the invitation of the Superintendent, Capt. Richard Powning, or "Capt. Dick," as he is more familiarly known, we resolved on a visit to the interior of the mine.

We prepared for the descent by encasing ourselves in a complete mining rig, of overalls, blouse and slouched hat; then, with candle in hand, we followed the Captain down the ladder way, preferring that mode of descent to going down in the "tub." The work upon the shaft which we descended, having been conducted by different parties, who, from time to time, had been in charge of the mine, does not not exhibit the uniformity of design and engineering skill, which always should appear in a work of that character, and which, doubtless, would have been manifested, had Capt. Powning been in charge of the mine from the start. Much care and judgment should be employed both in the selection of the locality and in the manner of sinking and securing the main working shaft of every mine, and especially of a mine of such value and destined to be so extensively worked as the Keystone. The mistakes and imperfect engineering of the early management of this mine will yet have to be remedied at considerable cost. Many thousands of dollars have been worse than thrown away on this work, in consequence of a lack of experience. The present Superintendent is making the best possible use of the work of his predecessors.

The descent to this, like that to all other mines of any considerable depth, is by a succession of ladders reaching from one platform to another, at intervals of about twenty-five feet, through which, in ascending or descending, the individual must pass by means of a small opening just large enough to admit of the passage of the body. From this shaft passages upon the right and left, lead to the various galleries and drifts where the workmen are engaged in breaking out the ore from its place in the mine. In the present instance, after descending about 150 feet, the visitor begins to come within hearing of a confusion of sounds, which come up from below—the noise of hammers striking upon drills, the stifled sound of the pick as the sturdy miner deals heavy blows at the crevices and yielding rock before him, the rattling of the shovel as the broken ore is raised from the drift and placed in the car or tub, preparatory to its journey to the surface or "grass" as it is technically termed, and human voices, rendered strangely hollow by the echoes of those cavernous depths, with now and then a dull heavy sound from a blast, fired in some adjacent gallery—serve to impress upon the mind of one, who for the first time finds himself in such a position, an indescribable feeling of wonder and astonishment at what he sees and hears around him. The glare of the feeble lights reflected against the black and dripping walls; the damp, cold, clammy and oppressive atmosphere of the mine; the pitchy blackness of the atmosphere and every thing else, a few feet from the candles, also serve to quicken one's perceptions as to the difficulties and dangers of mining; while, notwithstanding the most determined effort to put on a careless exterior, a peculiar nervousness will inevitably creep over the system—the infallible offspring of an intruding doubt as to the safety of your position. When you look around you, and observe the slender timbers, placed with so much care, as a support of the su-

perincumbent walls, the fear inevitably comes over the unaccustomed visitor, least those walls, of such immense weight and extending, perhaps, hundreds of feet above you, should suddenly crush in their feeble supports, and bury you forever from the light of day! You strive to smother the impressions with an assumed feeling of awe and admiration at the spirit of enterprise and daring which leads the miner to brave such dangers for the accomplishment of the great purpose of his calling—the extraction of the minerals, the sinews of the earth, by which, more than all other material things, nations are enabled to gain strength and importance among their neighbors, and accomplish mighty results in the great march of human progress!

While you are thus engaged in reverie, grand yet fearful it is a source of the utmost relief that your guide, whose attention has been engaged the while in some little matters of business connected with his care, suddenly calls your mind from its wandering and directs your attention to the busy scenes and interesting sights before you. He takes you to the extreme end of a drift where the recent blows of the pick and hammer have exposed the shining ore. The light from your candle, as you hold it near the walls, is reflected from a thousand sparkling "pyrites," or reveals to your vision the masses of "sulphurets," as they still remain, undisturbed, in the place where they were formed in the great laboratory of Nature. There they are, just as you have seen them in your little cabinet at home—the pyrites, the sulphurets, the hard grey ore, with here and there a small quantity of red or black oxides filling up some little crevice, where they have been deposited by some of the chemical reagents which are in constant yet slow action all around you. The carbonates have all disappeared. They are always found near the surface, and have long since been taken away.

You have now passed some distance from the main shaft. Your guide takes you into a little side drift and directs your attention upwards; you hold your candle aloft and look up—up into an impenetrable darkness! Your candle burns with renewed vigor, and flashes wildly; you feel a refreshing and invigorating draft, contrasting strangely with the damp atmosphere of the gallery which you have just left. You have approached an air shaft, which has been opened for ventilation. In all extensive mines, properly opened, you will find various airshafts, and longitudinal air passages, by which a constant natural circulation is kept up, without the expensive and inconvenient arrangements of "blowers," which always have to be put up in mines which are not opened with special reference to this important particular. You will find such an arrangement—two or three of them—on the Union mine adjoining the Keystone. They make a great deal of noise, require a large amount of power, and after all perform their office of ventilating the mine very imperfectly. A little of the right kind of knowledge, where two or more shafts are connected, will enable the superintendent to ventilate his mine without any such artificial means as "blowers." The Keystone, we believe, is nearly one hundred feet deeper than the Union, yet the former is thoroughly ventilated by the simple control of a natural draft of air. Of course, under all circumstances, the air of a mine must be quite impure at best. But we have been standing quite long enough near this "air-shaft" to become thoroughly ventilated.

Let us follow our guide. Here we are again at the bottom of the ladders, and our attention is directed to a windlass and bucket, just as we sometimes see them on the surface. On looking down we perceive that workmen are engaged in going down still deeper with the main shaft. The earth is hoisted from this extension shaft up to the "dump hole," by the windlass we have just noticed. To this "dump hole" is also brought the ore and water from the galleries and drifts upon each side of the main shaft, and from this point taken to the surface. If we wish to go down into this, the lowest part of the mine, we shall find no ladders, but the visitor places one foot in the "bite" of a rope properly secured, and standing perpendicularly, holds tight to another portion of the rope over his head, and thus swings himself off the platform over the abyss below. The windlass man, then lets him down, in the same manner as he does the "tub." Here we are, about 280 feet from the surface, in the lowest portion of the mine yet opened. From the bottom of this shaft galleries will soon be run in both directions. The vein between this and the level above will be "stoped" out, the "ladders" extended down, another "platform" built, and the windlass men again go on sinking; and so on down, down, deeper

and deeper, as long as the mine will pay in depth.

But our adventurers as well as our readers are getting quite exhausted; so without seeing half the sights in the mine, or exploring half its galleries and drifts, we will make the shortest possible way to the surface by an imaginary ride to day-light in the "tub," which in this case, happens to be worked by a horse-whim, and of course hauls us up more slowly than a steam engine would. Perhaps before we go down again, Capt. Powning will have his engine in operation, which, as we emerge to the day-light, we see a few feet in front of the shaft almost ready to "fire up."

## THE MINING SHARE MARKET.

The depression in the Mining Share Market, heretofore, of late noticed, still continues. So great, indeed, has it become, that it has already resulted in an evident disposition on the part of capitalists to call in their loans and reduce their risks on this class of stocks. The causes of this depression are not attributable so much to any lack of confidence in the ultimate success of the leading mines as the prospect of an endless litigation which seems to hang over them.

There appears to be a fatality, in this respect, which has ever cast a threatening shadow over the prosperity of California in every thing which pertains to a question of title. This great incubus seems to have followed our citizens in their transmontane migration, with even a more threatening aspect than it ever presented on the Western Slope. It has now become the especial curse of our land, retarding our prosperity in its most essential point—the development of mines—thereby turning from this coast the flow of capital which would otherwise set thitherward with a volume and uniformity without parallel in the history of past commercial transactions. It is difficult to determine to what point we are to look for even a ray of hope for escape from this terrible infliction. There is evidently a radical defect somewhere—perhaps everywhere—in our Judiciary, in our jury system, and among the people at large.

Ophir has still further declined. The sales of the week have been rather larger than usual, but altogether on time. Contrary to expectations there was no increase in the dividend, which was declared on Monday last. \$48 per foot is still the figure.

Gould & Curry is dull at \$4,400 on time.

The California is still inactive, awaiting the results of the Latrobe Tunnel, which is progressing slowly, in consequence of the precaution necessary to be observed to avoid damage from water, by striking the vein too suddenly. They are now very near the lead, and important developments may soon be expected.

The Central is about putting in a second pump, in connection with the California and Ophir.

The Chollar still remains comparatively quiet; few transactions noted. The prospects of this Company are most encouraging in everything, save its lawsuits. Their works now going up are very superior and the mine never looked better.

Potosi is still growing in favor, having met with a material advance. This mine is an exception to the general decline, and is now very firmly held at \$1,500. The probable postponement of the suits pending against this Company, coupled with the large yield of the mine for the past two months, is said to influence their stock very favorably.

Savage is not in much demand, notwithstanding the continued improvement of the mine. Report says that the quality of the ore improves as the works increase in depth. The Company will not put up a mill at present, preferring to wait further developments in working silver ores which they anticipate will be available by next spring. The mine of this company has been proved rich throughout its entire extent, and is probably as safe for investment as any mine in Virginia City. The "pay streak" of this mine is represented as fifty feet wide, and as soon as they can make arrangements to have the ore worked to their satisfaction, they will take out 150 tons per day.

The Dick Sides met with quite a heavy loss in the burning of their engine house, at the late fire, and some three or four weeks must still elapse before they will be able to resume work.

The Best & Belcher, on the contrary were gainers from the fire inasmuch as it cleared their ground of certain squatters, who had become quite annoying, giving them possession of

ground of which they will not again be quietly dispossessed.

Wide West has fluctuated from \$75 to \$115.

Utah is in some repute at about \$55.

Real Del Monte is in favor at \$300, buyer 30 days.

The Consolidation Antrim Company (Slate Range) is favorably mentioned. Some fine specimens of ore from this mine are on exhibition in this city. It is said that ore is now being taken from Antrim No. 2 which will yield \$2000 per ton. Rich assays have been obtained from ores found in the Slate Range District, and it is attracting a good deal of attention.

North American shares continue in favor, and have been largely sold; opened at \$74, advanced to \$90, and closed at \$78.

Baltimore American, dull at \$45; Echo, at \$50.

We subjoin the sales of the week.

## COPPER.

Copper still continues a matter of important enquiry "on range" and everywhere else in mining or general business circles. The stocks of productive mines are constantly advancing with holders firm. The time required in opening out copper mine, for sinking shafts and running levels, is as important to the value of the mine as a paying lode, and ore held to-day at \$40 to \$60 per foot, if well wrought, may advance within a year to much larger figures.

The Keystone has levied an assessment of \$5 to complete its machinery. The work of development is being pushed ahead at the expense of present shipments—the labor being devoted to that end.

The Napoleon still continues its usual shipments. Sales more to the amount of \$10,000 have recently been made and the net monthly earnings of the mine now reach a handsome sum.

The shipments of the Union now average about 800 tons per month.

The Copper Hill Company are shipping about 100 tons per month. The Company is said to be in a flourishing condition—no stock in the market.

The Table Mountain Company is still energetically at work developing their lode. Sales of this company's stock are reported at \$40.

In Sonoma county about fifty independent ledges have been struck, upon which it is estimated fully 1000 claims have been located. The Woodland Company have struck promising ore within fifteen feet of the surface. Twenty-five feet in this company's claim recently sold for \$30 per foot. One sale in the Union, an extension of the Woodland, is reported at \$400 to the share, (200 feet.)

In El Dorado county some rich strikes are reported, and the Home Copper Company is said to have found good ore at a depth of 75 feet.

In Placer county the different companies are vigorously at work, and a considerable amount of capital is being expended.

In Nevada and Yuba Counties the interest in copper is continuous, without any apparent abatement. In some of the companies shares have risen to \$100 per foot. Three or four companies have an abundance of ore averaging 40 per cent. of copper. The Prettman, or Well claim, Eureka, Last Chance, and Stillhouse claims are the most valuable.

The copper mania is still working its way northward. Copper croppings can be distinctly traced from Del Norte and Siskiyou counties from 60 to 70 miles into Oregon. The Dalles Journal publishes correspondence from Masco county to the effect that the Martillot lead yields copper assaying as high as 60 per cent.; the Star lead is fully as rich. (Probably specimens.) The Stonewall lead assays \$13 in silver in addition to its copper yield; the copperhead lead contains copper, silver and gold; the New Helvetia containing silver and gold is as rich in copper as the Martillot. There are a large number of other leads, in the same neighborhood. The regular silver leads have also been discovered in this locality, which are elsewhere more fully worked.

The Press of Victoria is also calling attention to the copper discoveries in that section. They warn their readers that gold deposits must soon cease to be remunerative, and that more reliable minerals must be sought.

The Colorado mines are also attracting an increasing degree of attention. The great importance of that region as a mining district claims special regard, being within our own territory, and possessing a traditional reputation. Reports of rich discoveries are of frequent occurrence, both in placer and vein. The Apache Chief Company, it is stated, have struck a valuable lead of copper, assaying some 60 to 70 per cent, and about thirty miles east of La Paz.

All the ores from that quarter which have arrived in this city reach a very rich assay. If the mines of that region continue to any great depth they must soon become of great value. There are some reasons for believing that they will result much like the Similor ores which, for some years, have been found in such great abundance in Chile, but which, of late, have been giving unmistakable evidences of an early exhaustion. It is to be hoped, however, that such may not be the result with the mines of Colorado.

In Sonora, also, so far from abating, the rage for mines, both in copper and silver, is strongly on the increase. A recent correspondent of one of our daily contemporaries, writes from that region as follows:—

"One operator, who had bagged only nine mines in a fortnight's run, was greatly chagrined to find that his friend and adviser had beaten the best ground and secured fifteen. He will probably be up on this steamer, disgusted with his ill luck. Let me here advise every one to be cautious of investments in copper mines in the low lands or coast strips of Sonora—all experience, with scarcely an exception, having proved these veins superficial and comparatively worthless. I stepped into the Prefectura half an hour ago and recognized ores of mines, just denounced and represented as "fabulously rich," which I examined by request of ex-Gov. Cubillas five years ago, and which were then rejected as worthless."

MR. EDITOR: Your correspondent "P" now promises that he "will not mislead your readers." The question was, did he not do so in his letter of the 3d ult.; he still intimates not, and refers me to a work of Dr. Hoffmann's. I may say, *en passant*, that though I have cause to remember, with gratitude, the instructions I received from that eminent Professor, I should not have selected him as an authority on metallurgy, as I believe from the days of his studentship, his attention has been almost exclusively devoted to organic chemistry. But even Dr. Hoffmann is against "P." In Fowne's chemistry, the 7th edition of which was "revised throughout" by Dr. Hoffmann, I find, after simple instructions for testing for silver with nitric acid and soluble chloride, with exposure to light, "Lead is the only metal which can be confounded with it." So much from Dr. Hoffmann as to the practical question whether "P." is misleading miners when he suggests instead of the above, a delicate operation which, in the end, he says may be complicated with antimony and bismuth. On the purely chemical part of the question, it is water and not hydrochloric acid which produces the subsalt of bismuth, which "P." means and if too much water were added the free nitric acid would at once redissolve it—its formation is however obviated by the use of enough acid. P. talks of "falling on me again." Your Cornish readers will understand me when I claim "the first fall" for

A. POOR CHEMIST.  
San Francisco, Sept. 7th, 1863.

BUCKEYE COMPANY.—This company, says the Territorial *Enterprise*, whose claim is located near Silver City, are now working their mine in a very energetic manner. Within the past four months they have opened their ledge in three places. In their north incline, which is down a depth of 170 feet, they have found good silver bearing quartz, but water came in so fast they were compelled to suspend operations at this point. The President and Directors arriving here about this time, at once contracted for a 30-horse power engine to keep the mine free from water. When this is in working the company expect to take out a large quantity of rich ore from this incline. The Superintendent a few days since discovered an old tunnel running in a distance of 90 feet, in which the ledge is found to be from 8 to 12 feet in width, the quartz bearing a resemblance to that found in Gold Hill. In twenty-four hours' time 40 tons of this rock was taken out. The company are confident that they can, after a short time, raise from 500 to 1,000 tons of ore each month. They have all the conveniences necessary at the mine; buildings for workmen, powder-house, office for Superintendent, etc. Roads are built of width and grade suitable for the heaviest loads, and nothing seems to be wanting to make this one of the best mines in the Devil's Gate District.

THE steamer Constitution, for Panama, took away 105 bags of Silver Ore, in addition to her large shipment of \$1,454,207 in treasure.

TELEGRAPHIC.—Ten thousand dollars have been subscribed in Humboldt and along the line, for the building of a telegraph to California. The line will be in operation in about three months.

AGE OF THE BIG TREES.—Professor Whitney, State Geologist of California, fixes the age of the mammoth trees forming the big grove of Tuolumne at one thousand two hundred and fifty years.

## GENERAL NOTICES.

DR. H. AUSTIN,  
DENTIST,

No. 634 Washington street,

Between Montgomery and Kearny, (over San Francisco Baths.)

I have recently received from London a New and Beautiful Vulcanite (India Rubber) for Artificial Teeth, which is far superior to any other ever used. It is light, clean and durable, and of a natural color. The cheapest and best material for temporary (and in many cases) permanent sets. All operations thoroughly performed, and at reasonable prices.

je-29

## DESKS

AND

Office Furniture,

OF ALL KINDS..... FOR SALE BY

JOHN WIGMORE,

No. 423 CALIFORNIA ST., SAN FRANCISCO.

OFFICE JOBBER, of all kinds, attended to.

## SQUARZA'S PUNCH.

FIRST PREMIUM

AT THE SACRAMENTO AGRICULTURAL STATE FAIR FOR 1862.

ALSO; FIRST PREMIUM

At the San Francisco Bay District Agricultural Fair, 1862

MANUFACTORY, WHOLESALE AND RETAIL,

## New Patent Agency.

WE HAVE CONNECTED WITH THE

Publication of the "MINING AND SCIENTIFIC PRESS"

The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

Mining and Scientific Press Agency The most desirable place to make application for Letters Patent on the Pacific coast. Apply at Office of the "Mining and Scientific Press," Room No. 57, Government House, corner of Washington and Sansome streets, San Francisco. EWER & SMITH.

FOREIGN PATENTS OBTAINED By application at this office, Room 27, Government House. EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 57, Government House. Terms moderate. EWER & SMITH.

## PATENT RIGHTS.

Patent Rights Bought and Sold,

At the office of the "Mining and Scientific Press" Agency EWER &amp; SMITH.

## IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors. EWER & SMITH.

## Offices To Let,

In the Government House, Corner of Washington and Sansome Streets. Two large suits of Offices, the most commodious and accessible in the city. C. A. CRANE, Proprietor

## GENERAL NOTICES.

NO. 516 SANSOME STREET

[CORNER OF MERCHANT,]

SAN FRANCISCO.

## WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 2016-4f ZENAS WHEELER.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

Staple and Fancy Dry Goods,

CARPETS, DUCK, ETC.,

Cor. Front and Sacramento streets,

SAN FRANCISCO.

## REMOVAL.

OFFICE OF THE PACIFIC METAL Surgical Office is removed to 509 Sacramento street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased. COPPER ORES.—Highest market rates advanced to cash, for shipments. S. C. BRADSHAW, Agent, 509 Sacramento street, near Sansome.

## NATHANIEL GRAY,

General Furnishing Undertaker,

641 Sacramento st., Cor. of Webb,

SAN FRANCISCO.

AT 9 O'CLOCK, A. M., PUNCTUALLY.

And connect, via Panama Railroad, at Aspinwall, with teams for New York.

For Freight or passage, apply to

A. B. FORBES, Agent.

je4 Corner of Sacramento and Leidesdorff sts.

FOUNDRIES & MACHINE SHOPS.

**REYNOLDS'**  
Patent Cut-Off and Governor,  
FOR STEAM ENGINES.

137 of these Invaluable Machines,  
ARE NOW IN USE  
In California and Nevada Territory, giving a perfectly  
regular motion and  
Saving 20 to 65 per cent of the Fuel.

**Steen's Improved Governor**  
Is the CHEAPEST, SIMPLEST and QUICKEST to act  
and least liable to get out of order of any Governor in use.  
It can be seen in operation at the Golden State Iron  
Works, and at the Stone Breaker, foot of Market Street,  
San Francisco.

**Clark's Steam and Fire Regulator,**  
For controlling the Draft or Blast by opening the Chim-  
ney or Valve in the Blast pipe by the pressure of the  
steam in the boiler. It will regulate the pressure to a  
pound, on the square inch. It cannot get out of order  
and any person can put one up in an hour after the dam-  
per is put in.

**Ingersoll's Patent Drill Press,**  
With which drilling can be done the same as with the  
common ratchet, and when small holes are wanted, it  
can be done four times as fast. The handle can be wor-  
ked in any direction.

**Felt for Steam Boilers, Pipes, Etc.**  
At the lowest market rates.

**Steam Engines, Boilers, Pipes,**  
Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest  
market rates.

**Anti Incrustation Powder,**  
A Sure Remedy for Scale in Steam Boilers, without injury  
to the iron. In use for the past EIGHT years.  
Refer to—Sugar Refinery, San Francisco,  
Cottell & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.  
**E. T. STEEN AGENT.**  
No. 33 Fremont Street, San Francisco.

**MOYNIHAN & AITKEN,**  
**Boiler Makers and Blacksmiths,**  
Mission, between Beal & Fremont Sts.,  
San Francisco.

**N. B.** All kinds of Boiler and Sheet Iron Work exe-  
cuted at the shortest notice, and on the most reasonable  
terms.

**PUMPS!**

**HARRISON'S**  
**California Lift and Force Pump,**  
WITHOUT VALVES OR PACKING,  
Suitable for Mines, Fire Engines, Wrecking or Irriga-  
ting. This is the Cheapest, Lightest and Most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

**ALL SIZES;**  
Capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute—For sale by

**C. H. HARRISON,**  
**PHOENIX OIL WORKS,**  
je-15 517 Front Street, San Francisco.

**50 lbs. MARINE and**  
**Fire-Proof Paint,**

**MANUFACTURED BY THE PACIFIC METALLURGICAL**  
Works in this city, for Hulls and Decks of Vessels  
from ground Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
or Bottoms of Ships, it is equal to a coat of Stone,  
and quite equal to Copper, no worms will ever effect it,  
and cheaper than any other paint.

**DIRECTIONS:**  
For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur,  
three parts Mineral Paint, mix with Coal Tar and apply  
it hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes  
of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**  
When used on Roofs, Buildings, or Fences, it is equal  
to covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

**DIRECTIONS:**  
**HOUSE**—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil; if a lighter color is  
wanted, mix less paint, more lead.  
**ROOF**—Five parts of Mineral Paint, one part white  
Lead; mix with Linseed oil. Put it thick on a tin Roof  
as one coat when properly applied will last three years.  
**S. C. BRADSHAW, Agt.,**  
**G. T. TORQUE, Superintendent.**

**WORKS, North Beach; Office, 509 Sacra-**  
**mento st., San Francisco.**

FOUNDRIES & MACHINE SHOPS.

**PALMER, HANSCOM & CO.,**  
**GOLDEN STATE IRON WORKS,**  
No. 19, First Street, San Francisco,

Furnish Castings and Machinery of all kinds

ALSO:  
**GENUINE WHITE IRON SHOES AND DIES.**

**PALMER, HANSCOMB & CO.**

**To Quartz Miners.**

**Knox's Improved**  
**AMALGAMATING PAN,**  
WITH

**PALMER'S PATENT STEAM CHEST.**

**THE ABOVE COMBINATION SECURES THE MOST**  
complete amalgamation of the precious metals of  
any process now known.

By its steam is introduced in the most effective and eco-  
nomical manner, while it is peculiarly adapted to the  
catching of floating gold and silver, known to be other-  
wise lost. Made exclusively by

**PALMER, HANSCOMB & CO.,**  
**GOLDEN STATE IRON WORKS,**  
No. 19 & 21 First Street, San Francisco

The public are informed that Letters Patent have been  
granted the undersigned upon Steam Chest False Bot-  
toms for the inside of Amalgamating Pans or Tubs, and  
are cautioned against making, buying, using or selling  
the same without his consent. **W. A. PALMER.**

**JOHN P. GALLAGHER.....JOSEPH H. WEED.**

**GALLAGHER & WEED,**

**BRASS & BELL FOUNDRY**  
**AND**  
**LOCK FACTORY.**

No. 125 First Street, opposite Minna, next door to Pacific  
Foundry, all kinds of

**Finishing, done with neatness and**  
**dispatch.**

**CHURCH AND STEAMBOAT BELLS, OF ALL SIZES**  
Made to order. Engineers Gongs made and hung  
in the best manner. Bank, Vault, Store and Prison  
Locks, also brass Padlocks and Shop Locks of various  
patterns, on hand and made to order.

Particular attention given to casting Rudder Braces  
and Ship Work in general.

All Jobs promptly attended to.—Prices  
moderate.

Removed from Oregon street, between Front and Davis.

**Miners' Foundry**

—AND—

**MACHINE WORKS,**

**First St., between Howard & Folsom,**

**SAN FRANCISCO.**

**EVERY DESCRIPTION OF IRON AND BRASS MACHIN-**  
ery, the Best and Most Economical, manufactured  
in the State of California, will be furnished with dis-  
patch at the Miners' Foundry and Machine Works, as:  
Steam Engines and Boilers, Flour, Saw and Quartz  
mill machinery, Mining Pumps, Amalgamators, Retorts,  
Etc., Etc., Etc.

Particular attention will be given to the manufacture  
of Machinery in Sections, designed for places of difficult  
access. Various models of Quartz Crushers, Amalgama-  
tors and Water Wheels—some in operation and on exhi-  
bition.

\* \* Parties desiring to test their ores practically, in  
small quantities will be afforded ample facilities, free of  
cost.

All parties desiring accurate and highly finished draw-  
ings and Superior Machinery, at most reasonable rates  
are cordially invited to call before contracting elsewhere

**HOWLAND, ANGEL & KING**  
San Francisco, February 23, 1863.

**San Francisco Machine**

....AND....

**IRON WORKS!**

North-east corner Fremont and Mission Streets.

SILVER DISCOVERIES IN OREGON.

The *Dalla Journal* publishes correspond-  
ence from Wasco county Southern Oregon,  
announcing the fact that a large percentage  
of silver has recently been discovered to ex-  
ist in the copper ores of that vicinity. In  
addition to silver in connection with copper,  
regular silver ores have also been discovered.  
The correspondent alluded to says that these  
silver leads have been discovered since the  
1st of August, and that although none of  
them had been assayed, they have been suffi-  
ciently tested to warrant us in saying they  
contain a large percentage of silver. The sil-  
ver leads are known as the Barker lead,  
which resembles exactly the Comstock lead  
of Washoe; the Mammoth, the Home Tick-  
et, the Fulton and Pioneer leads, we are now  
prospecting, and as we go down, they im-  
prove in quality.

A great draw on the mines of that region  
is found to exist in the lack of facilities of  
transportation. The miners are talking of  
putting up furnaces for reducing their ores to  
regulus. They will find it a hazardous ex-  
periment, except it be done by parties of the  
fullest experience. Much confidence appears  
to be felt in the future value of that region.  
If such anticipations are realized, on a proper  
development of the mines, neither capital nor  
facilities for transportation will long be lack-  
ing.

**Eye, Ear and Throat.**

**DR. DE CASTRO,**

**Oculist and Aurist,**

**WHO HAS PRACTISED IN NEW**

York and all the principal cities of Europe with  
such unrivalled success, and from each place is pos-  
sessed of the most eminent testimonials, may be con-  
sulted upon diseases of these delicate organs, with a view  
to their permanent cure. Deafness of long standing thor-  
oughly cured. The Doctor employs his (by the Medical  
Society of London approved)

**Self-adjusting Artificial Tympanum,**

For the relief of deafness, attended by loss or injury of  
the membrana tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of  
the paper, and several members of the Society bore tes-  
timony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a deplorable  
state; the effect of the tympanum was instantaneous—  
quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

**Mr. Editor—Having been afflicted**  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it is with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to recom-  
mend Dr. De Castro's skill as an aurist.

**JOHN REESE, Napa Valley.**

**James Callaghan, witness,**

**San Francisco, July 30th, 1863.**

[From the Daily Alta.]

San Francisco, June 30th., 1863.

**ED'S DAILY ALTA:**

Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearny and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly; and is now, I am happy to state in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skillful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.

**MINING & SCIENTIFIC PRESS.**  
THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.  
This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

**The Mining Interest!**  
Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Mi-  
ning Stocks, new inventions of Machinery adapted to that  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

**The Inventor!**  
Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with facilities  
at Washington that enable them to obtain Patents  
with dispatch.

**The Mechanic and Manufacturer!**  
Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engra-  
vings of new machines and inventions, together with a  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

**To Chemists, Architects and Millwrights.**  
This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of in-  
formation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

**Terms.**  
To mail subscribers:—Four Dollars per annum  
**Club Rates.**  
Five Copies for Six Months, \$5.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.  
For all clubs of Twenty and over, the yearly subscrip-  
tion is only \$2 50. Names can be sent in at differ-  
ent times and from different Post-offices. Specimen  
copies will be sent gratis to any part of the country.  
**EWER & SMITH, Publishers,**  
Room 57, Government House, Corner of Washington  
and Sansome streets, San Francisco.

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, SEPTEMBER 21, 1863 NO. 47.

## REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

## INVENTORS AID ASSOCIATION.

Ever since labor-saving machinery has played an important part in the production and development of wealth, it has been well known that many valuable discoveries have been kept long from public knowledge, by reason of the lack of pecuniary means on the part of inventors. It is not unfrequently the case, also, that important inventions are thereby entirely lost to the world. To obviate such an evil and to foster and encourage inventions and industrial pursuits generally, an Association has recently been formed in Paris, known as "The Society of Credit for Inventors," which has for its object the assistance of inventors, by furnishing those who have made valuable inventions, but have not the ability to bring them out, with the pecuniary means for doing so. The Association is a kind of Banking Institution and its action is regulated by two Boards of Officers; the first consists of scientific and practical men who pronounce upon the technical value of an invention or improvement; the second Board estimates the probable prospects of the same in a financial point of view. The two Boards, in conjunction, as they deem it necessary can call in competent persons, experts, with whom to advise in matters upon which the Board may not feel themselves thoroughly informed. Of course, the losses which must sometimes occur, will be met by the large interest obtained from successful operations.

Much benefit is expected to be derived from this Association, in the stimulus which it will extend to national genius, and national values which will thus be created in the field of mechanical research and improvement. The idea, we believe, is new; it is certainly generous and noble. Under its workings true merit can scarcely fail of its reward. We have often seen the need of such an institution. Indeed, as we write, we have our mind upon some two or three inventions in our own State, of the most undoubted value, which are remaining at rest, from the lack of means on the part of inventors to properly bring them out. Two of them are full of promise of the utmost importance to the great mining interest of the State. Of all countries in the world our own is most in need of such an institution. Such an enterprise, properly managed, could scarcely fail of being a good investment to stockholders, and a healthful stimulus to the genius for discoveries and invention so characteristic of our people.

## HYDRAULIC MINING.

We notice a well written and suggestive article in the Sacramento *Union* of the 18th instant, on the general subject of Mining on the Pacific Coast, in which Hydraulic Mining is mentioned merely incidentally. Wonderful as are the developments which the writer of that article truly describes as being made in the search for the precious metals in their native lodes of quartz, the deep placer diggings, now so extensively being worked by the application of hydraulic power, are worthy of more than a mere passing notice.

For the first few years after the discovery of gold in California, nearly all the precious metal was taken from surface, or placer diggings. Millions of dollars were taken out mostly from these shallow deposits. Of late years this class of diggings has been dropped by white men as unprofitable, and has now nearly all passed into the hands of Chinamen.

As these shallow diggings began to give out, the miners gradually opened up a new class of deposits known as "deep diggings," which are worked by a new process first introduced into practice in California and known as hydraulic mining—a process too familiar to most of our readers to need a description. The more shallow and most easily accessible of this class of diggings were first attacked, and with very good success, by a low pressure of water. As these diggings were traced further and still further into the hills, a larger volume of water was needed to break down the banks, and a higher pressure, partly from the less yielding nature of the gravel and in part from the necessity, as the bank before the miner increased in height, that the pipe-man should stand at a greater distance from his work to secure safety from the caving down of the gravel, as he undermined the same with his stream.

In order to meet this constantly increasing emergency, various devices have been resorted to for strengthening the hose so as to make it stand the desired pressure. Double and treble thicknesses of canvass have been employed at great expense, and galvanized iron hoops have been contrived for the manufacture of "crinoline hose," as it was termed; the expedient of securing hose by winding it with small ropes has also been attempted, but all without any decided degree of success, for various reasons, which it is unnecessary to enumerate here. The developments of this branch of mining are most important and interesting, and the progress in that direction thus far, encourages us to hope for an almost uninterrupted extent of these deposits. Our deep diggings are very much like our quartz mines in the nature and immediate consequences of their developments—The more, thus far, we have opened them, the more extensive are the proportions which they assume; and even now more ground of this description has been proven than can be worked out in the next fifty years. At this time and forever henceforth, the chief part of the gold from our placer mines must come from the "Hydraulic diggings." The only serious drawback to this class of mining is the difficulty encountered in obtaining hose of sufficient strength to stand the immense pressure necessary to prosecute this work with success in deep ground and in hard, cemented gravel. It has, for some two or three years, been held a *desideratum* of the greatest

magnitude to contrive a hose which shall be light and flexible, so as to be capable of convenient use and at the same time possess the capacity of resisting the pressure to which it is necessary to expose it. Any person who can accomplish this object will do as much to advance placer mining, as McCormick with his reaper has done to advance agriculture. There is money—there is fortune in the idea. A more worthy object for a leading prize at our State Fair could not be mentioned.

## CALIFORNIA COPPER SMELTING WORKS.

The first result from the Copper Smelting Works at Antioch came down on Monday last in the shape of a bar of copper, the first copper ever obtained outside of a crucible, on the Pacific Coast. Any doubt which may have hitherto existed with regard to the suitability of Mount Diablo coal for smelting copper has been removed by the success thus attending the first "firing up" of this furnace.

The field of success seems now fully opened to the Company, and the only obstacles in their way, other than those of their own creating, will be such as are always incidental to even well understood undertakings attempted in untried localities and under ordinary changes of circumstances. The introduction of a new industry into the State, and one of so great importance and complexity as the one just initiated, is not to be fully accomplished except upon much thought and the exercise of the most mature judgement.

Too much credit cannot be given to the indefatigable Secretary of this company, R. W. Emerson, Esq., who has conceived and brought to a successful state this important enterprise.

The stockholders of this company, are not the only parties who are interested in a favorable result. The entire California public are watching with much interest the developments which this company is making in a branch of industry, which if successful, will open up an almost illimitable field for the employment of capital, and add millions of dollars to the value of a most important class of mines, which are just now beginning to be opened up among us.

There are numerous mines of low and peculiar grades of ores, already opened and to be yet discovered, which can never have any value except upon the hypothesis that the ore can be smelted here. Every mine property in the country is interested in the present experiment; as there is no mine which does not turn out much ore that will never pay either for shipment or transportation. The pioneers in this enterprise may be considered in the light of public benefactors. We shall watch with much interest the further development of these works.

SPECIAL NOTICE.—MR. LEIGH HARNETT has been appointed our Special Agent to visit the Counties of Calaveras and Amador, to make collections and solicit subscriptions for the MINING AND SCIENTIFIC PRESS. Mr. H., who is a thorough practical miner and well skilled in the use of the pen will also act as correspondent, and furnish much valuable information with regard to the copper mines of those important counties. We bespeak for him a cordial reception from our mining and other friends.

## OWEN'S RIVER CANAL COMPANY.

This company has been incorporated for the purpose of constructing a canal in Owen's River Valley in the Counties of Mono and Tulare, State of California. Its object and prospects are fully set forth in the following Prospectus just issued by the Company.

The principal object is to furnish motive power to work the vast number of Mineral Lodes, in the Inyo, and Russ Districts, (situated in the Inyo Mountains, on the East side of Owen's River, commencing at the foot of Owen's Big Lake, extending thence northwardly the entire length of the Lake and (River,) also with a view to the transportation of wood and lumber, from the timber regions at the head of Owens River, to supply the Mining and Agricultural wants of the country along the line of the canal and adjacent thereto.

The scale on which the canal is planned is sufficient to admit of its employment as a means of transportation. A careful survey has been made by J. E. Clayton, a competent Civil Engineer, employed for that purpose. A Lithograph Sketch of his plan, and some brief statements based upon his report, or some extracts from it will give the reader some idea of the work, feasibility, costs, and results.

"I found," says Mr. Clayton, "the point selected by Messrs. Lambeth & Whigham for the mouth of the canal, exceedingly well adapted to taking the water from the river, commencing as it does at the southern extremity of an arm of the river, forming a natural canal for nearly one-half mile, and about one and a half miles above the new town of San Carlos, on Owen's River. The Arm or Slough, as it is sometimes called, has high banks which are never overflowed by the highest stages of water. The river is very narrow, at its junction with the slough or natural canal being not over sixty (60) feet wide, and the most feasible point for the construction of a dam on the river. You will find it marked on the sketch as Initial Point, showing the level of the river as found at that date—November 20, 1862."

The singularity of this river is that it discharges a constant volume of water, being fed only by springs and the gradual melting of the snows, annually deposited upon the Sierra and Inyo mountains, whose tops rise to the height of 4,000 to 6,000 feet above the level of Owen's Valley, which is a beautiful valley formed by alluvial deposits from those two great ranges of mountains, and averages about ten miles wide, and 140 long. It contains by Government Survey, 592,040 acres, 200,000 acres of which is splendid agricultural land, all of which has been surveyed and sectionized, and the Plats returned to the Land Offices, at Visalia and Stockton, a copy of which can be seen in the Company's Office.

Through this valley flows the waters of the Owen's River, which takes its rise in Mono county, about 40 miles southwest of Esmeralda, on the Eastern Slope of the Sierra Nevada, and in the midst of a dense forest of Pine, Fir, Tamarack and Oak, which line its banks and extend back for many miles, showing that an unlimited supply of timber is here to be had for the country lying South, which is now destitute.

It then meanders through this valley, with a gradual descent of about 20 feet to the mile for a distance of 140 miles and empties its waters into Owen's Lake. It is said to be navigable for steamers of 75 tons burthen, (after the contemplated improvements are made,) at the lowest stages of water, and will afford, at all seasons of the year, an unlimited supply of water for Mining, Milling and Agricultural purposes. And, unlike most rivers in California, the supply is greatest in the summer season, the time it is most needed, and never subject to sudden rises, which is an admirable feature of this enterprise.

We will now show by facts and figures to all parties interested in the Owen's River Mines, the great advantage to be derived by every owner of "feet," and the owners of canal stock, when this great enterprise has completed the first five miles of the canal. The Steam Mills now working in Russ District, find by actual experience that their motive power for a ten-stamp mill costs \$60 per diem, or \$6 per tun for each tun worked, to say nothing of the many other contingent expenses, which are continually occurring where steam is used as a motive power.

The Canal Company proposes to furnish water for a motive power at one sixth of that cost, or for one dollar per stamp, and perhaps less.

According to the estimate of J. E. Clayton, the engineer of the Company, there will be a sufficient volume of water in this canal to run fifty mills of 20 stamps each, making a total of 1,000 stamps. We have no hesitation in saying that in a

few years, all the water to the full capacity of the canal will be required.

Allowing 20 days as the running time of the mills per month, one mill of 20 stamps, would give a monthly yield of \$400.00.

For 50 mills of 20 stamps, .....\$20,000.00.  
Allow for salaries of officers and employees, repairs and other expenses, ..... 2,000.00.

The net result would be ..... 18,000.00, or \$216,000.00 per annum.

The returns from the motive power would soon re-emburse the first cost of the work.

Other sources of income from the canal—transportion, irrigation, lumbering, etc., need only be referred to.

It is no stretch of the imagination to suppose that fifty mills, of twenty stamps each, will be in operation inside of a few years, when we turn to Washoe and see there, to-day, one hundred mills in operation, some of which have fifty stamps, and still more are being built.

We here quote from the Territorial *Enterprise* the following statistics:

"The number of Mills in Nevada Territory is 100, ranging from five to fifty stamps each, which are in constant operation.

The following amount of treasure has passed through the office of Wells, Fargo & Co., at Virginia from April 1, 1862 to July 1, 1863.

For the quarter ending April 1, 1862,.....	\$270,000.
" " " " " July 1, " .....	570,000.
" " " " " Oct. 1, " .....	800,000.
" " " " " Jan. 1, 1863, .....	956,000.
" " " " " April 1, " .....	1,270,000.
" " " " " July 1, " .....	1,600,000.

Total amount for the past eighteen months, \$5,466,000.  
Estimated amount of the yield of bullion on the eastern slope for the year 1863:

Virginia City,.....	6,000,000.
Silver City and Gold Hill,.....	10,000,000.
Empire, Ophir and Dayton, .....	8,000,000.
Esmeralda, .....	4,000,000.
Reese River and Humboldt, .....	2,000,000.

Total, \$30,000,000.

All ores working four hundred dollars and upwards are shipped to San Francisco."

It is confidently asserted by intelligent parties who have made it their business to examine the mines, and the resources of all those vast mineral regions, that Owen's River is not second to Washoe in its future prospects and destiny.

To assure the Public that this Stock has an intrinsic value, and that the Company will be in a condition to pay dividends, at an early day, the trustees have set aside to be sold on account of the Company, 3,000 shares of full paid, or unassessable Stock, and 2,000 shares of assessable, the proceeds of which shall be applied to the completion of the works.

The office of the Company and its place of business is in San Francisco, 328 Montgomery street. A. J. Downer & Co., 406 Montgomery street, are the authorized agents of the Company, who will dispose of the Stock in such quantities as may be desired—and give such information to parties wishing to invest, as they may require.

We would here beg leave to call attention to the fact of the trustees having set apart the one-half of the capital stock to be sold on account of, and for the benefit of the Company. It is obvious, that a Company with such large resources in the way of marketable stock, will seldom if ever be obliged to resort to assessments to prosecute the work. In no case, is it reasonable to suppose that there will be more than ten per cent. of the capital stock called in by assessments, and that would be at such intervals and in such amounts as not to be felt by the owners of assessable stock.

Estimated cost of ten miles of the work, as made by J. E. Clayton, civil engineer:

Dam in the river,.....	\$2,500.00.
Lock and flood-gate.....	2,500.00.
Iron and smith-work,.....	500.00.
Lumber for waste-gates and various other purposes—30,000 feet, @ \$150 per 1,000 feet, .....	4,500.00.
Excavating the first section of five miles to De Bend City—4 feet deep with an average width of 27 feet, 105,600 yards @ .30, .....	31,680.00.
Excavating 5 miles, additional, to a point at the Union Lode—105,600 yards @ .30, .....	31,680.00.
For improving the cañon 15 miles,.....	60,000.00.
One Saw Mill, in running order,.....	15,000.00.
Contingencies, .....	15,000.00.

Total Cost of 10 miles of Canal, and river

improvements for 15 miles, etc., ..... \$163,360.00.

It is manifestly evident that this Canal when completed will furnish motive power for running a quartz mill at a cost of not more than 25 per cent. that of steam power. This would be a saving to any company working a ten stamp quartz mill in Owen's Valley of full \$40 per day, or \$800 per month of twenty working days. This saving upon the cost of steam power would enable a company having a paying lead in that vicinity and a ten stamp mill propelled by water from this canal to make a dividend of one per cent. per month, on a capital of \$80,000. This additional value of the stock of the mining company would give an enhancement of \$40 per foot upon a mine of 2,000 feet mining ground. The increase of value to the mine upon a large scale of operations can be readily perceived.

[From an Occasional Correspondent.]

VIRGINIA CITY, SEPT. 12, 1863.

On my way over here I stopped at the Zinc House Mines and was almost astonished to see some of the good looking ore being raised and sacked. The remembrance of a former excitement, of surface gold diggings in that neighborhood, had prepared my mind to doubt all their pretensions. I obtained a few feet in two different locations in which some of the leading Bankers of Sacramento City and Nevada County are owners.

I was sorry that I did not possess an agency for your valuable paper, whose claims I *ably* advocated, and no less than two parties promised to raise a subscription club and send on.

I had a clipping in my memorandum book, on "Copper Ores and Prospecting for Copper," that would really have been worth to some of them the whole price of one year's subscription.

An old lady friend was eager to know if a certain heavy specimen she exhibited to me was not silver ore.

The application of a pocket magnet showed unmistakable indications of iron. At their mine near the House, were three classes of rock saved separately and each class suspected of being mineral and perhaps rich; but in what metal they knew not. Why all this suspense and laboring in doubt, when by their using the plain instructions given from time to time in your paper, and by an outlay of not more than one dollar for chemicals, they can make scores of tests as to the quality or kind of mineral they are handling; and by a little practice will find it sufficiently accurate as to quality for all purposes of the prospector? You need a good traveling agent all the time on the miners' trail, or rather I mean the miners all need just the information given in the *SCIENTIFIC PRESS*, and I fear will not know of the paper only through an agency.

I would hint that it is my opinion that the Pocket Magnet could be used much by our prospectors, where it is now used but little. For example, in my little trip over toward Walker River, S. E. of Virginia City, about 38 miles, in the new district called "Silver Lake," I carried only a small horn and a small pocket magnet.

During the first afternoon, I and a companion from your city, visited the principal claim owned by Washburn & Co., and on returning to camp, found much float mineral rock. My companion filed a caveat on these good indications, and left that evening for Virginia City, with samples for assay. The next day, solitary and alone, I strolled around the hill sides, finding more and far richer samples and masses of the same. I broke off with my hatchet some good samples and pulverized them on a smooth rock. But lo! the mischievous magnet coveted every particle of sulphuret. Yet I carefully took the whole sample along until I found a little spring and there horned off the light and took new proof that it was iron and sulphur and a little mica which had given it somewhat the appearance of horn silver. The other party gave five dollars for a fire assay which gave no button of any kind.

This new district now centers in the Washburn claim which has an immense chimney of quartz cropping out 4 or 5 feet high and 8 or 10 feet wide. The croppings assay over thirty dollars. The character of the rock is argenteiferous galena. They are about to drift through the ledge about 30 feet below the surface, and are quite sanguine of a big strike. I hope they may, for they seem worthy of good success.

Galena, if it is not rich enough to smelt, has not hitherto been worked successfully by our wet processes. This is now one of our problems to solve. Some of the experts say lime added will change the lead to a carbonate of lead (white lead Pb O, CO<sub>2</sub>). I think I will go out to Reese River this fall.

# THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

## ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

## METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

## EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

## EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

## BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1880, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,

TAY, BROOKS & BACKUS.

THE OPPOSITION STEAMER, MOSES TAYLOR, will leave this port on the 3d. of October, Passage has been fixed as follows:—

Staterooms, upper deck saloon, \$160; main saloon, \$135; second cabin, \$90; steerage, \$60.

CHANGE OF ROUTE.—In consequence of the extreme low stage of water on the San Juan river, notice has been given that the Moses Taylor, in her next trip will run direct to Panama. Passengers will be promptly taken across to the steamer on the other side, which will be there to receive them.

The steamship America, of the Nicaragua line, is to be overhauled and repaired, and sent to the Pacific to run in connection with the Moses Taylor. The Illinois and Retribution will be the connecting steamers on the other side. The first named is announced for October 3d. The Company is constructing a new dock on the Jersey side of the river, at a cost of \$100,000.

Passengers who have traveled by this route speak in the highest terms of the accommodations, and of the gentlemanly conduct of the officers of these steamers.

NEW INVENTION.—Ira D. Card, one of the most promising inventive geniuses on the Pacific Coast, has just completed a machine for Tire Upsetting, which by the aid of a lever, will bring to the desired circumference, almost instantaneously, the most obdurate cart wheel in use. Mr. Card will exhibit the machine at the Fairs which soon take place at Stockton and Sacramento. Letters Patent for this machine were obtained by Ewer & Smith of the MINING AND SCIENTIFIC PRESS Patent Agency.

G. E. MOORE,  
Assayer and Analytical Chemist,  
No. 612 Sacramento Street,

HAVING ESTABLISHED A CHEMICAL LABORATORY, furnished with every requisite for delicate Analytical work, is prepared to execute the Assay and Analysis of Ores, Mineral Waters, Guanos, etc., with accuracy and dispatch.

W. BOHM, Patentee.

## REESE RIVER.

The special excitement of the day appears to be Reese River. The daily reports from this interesting locality are really quite exciting. The rush thither, notwithstanding the near approach of winter, increases rather than diminishes. Not only from Washoe, California and Oregon, but also from Salt Lake, crowds of men women and children are pressing into this new silver land. A late Virginia paper records the fact that the day previous not less than 60 names were booked at that point for Austin, the central point of the Reese River region. Many go there with limited means, in the hope of acquiring fortune by accident rather than by systematic prospecting or labor. Good leads, in great abundance, are no doubt already opened, and many more are to be discovered; but there is little probability, that more than one in ten of those now going will be counted among the lucky ones. It is too distant and expensive a country to prospect in without means, and there is not yet sufficient capital there to open, even to a limited extent, (and thereby create a demand for labor) a tenth of the leads already known.

Let those who contemplate going there defer their trip till next spring. But little can be done there this fall or winter, and the cost of living in that distant region will be very high, to say nothing about the extreme difficulty that will no doubt attend the procurement of proper shelter, even with an abundance of means at hand. It is feared that much suffering will be encountered there during the coming winter. Most of their flour comes from Salt Lake, a most precarious base of supplies.

## THE MINERS AND MILLS.

We do not make these remarks from any lack of confidence in the mines. We have the utmost faith, not only in their richness, but in their extent as well. We are fully satisfied that Reese River will prove fabulously rich in silver, and will soon become second in importance to no mining district on the globe!

There are now recorded and located in the mining districts of Reese River about 1,300 different mining companies. Nearly half are separate ledges. Mount Hope has about 75 companies; Ravenswood, 85; Simpson's Park, 230; Big Creek, 250; Smokey, 350; Summit, 100; Santa Lee, 70; Grass Valley, 15; Union, 20; Cortes, unknown. Numberless new ledges are being discovered and new towns are springing up as if by magic.

Four mills are now constantly running at Austin and Clifton, and one on Big Creek Cañon, and all crushing rock that pays extraordinarily rich. The value of ground in all these districts has advanced enormously within the past two months, with decidedly upward tendency. These mills have already sent down a number of most unmistakable "indications" in the shape of good sized "bricks," of high assay. Two other mills will soon be in operation in that region. Of course these mines are as yet but slightly developed. Most of them have had only the few days of work done upon them necessary to hold the claim until another year. Others have been stripped along the surface, merely to show the continuity of the ledge, and to get out a few tons of croppings for a test crushing. A few have been opened a depth of a hundred feet or more, by tunnel or shaft, but what is of the greatest importance, nearly all that have been tested by practical process, have even exceeded all anticipations, and the bricks that are now being turned out daily, are such tangible evidences of the value of the mines as to convince even the most skeptical.

## CAPITAL GOING THITHER.

Capital is fast finding its way into this region, and not a few men of means are quietly at work buying up claims, some for permanent investment, others for speculative purposes. A large amount of European capital is also seeking employment there. A degree of confidence has already been established which gives high hope of an early and rapid development of the resources of this new Silver Land.

## TELEGRAPHIC COMMUNICATION.

True to the instincts of the great American people, the practicability of a telegraph has already been looked into, and a connecting link with Humboldt and the rest of mankind may be looked for early the ensuing season,

## CLIMATE, LABOR, ETC.

Snow falls at Austin sometimes to the depth of five or

six feet. The winters are not excessively cold, however. The summers are pleasant and agreeable. There is an abundance of grass for stock. Horses and mules are ranches and properly looked after for one dollar per week. They may also be turned loose, and obtain a very good living, but under such circumstances they are liable to change hands suddenly. The price of labor at Reese River is about the same as at Virginia City. Persons going thither can go most economically with their own animals. The distance from Sacramento is about 340 miles and can be made on horseback in about twelve days. Those who go there, the present season, should be amply provided with funds. Prospecting will soon be over with until next spring. Those who go to speculate in "feet" or to erect mills, will do well to go at once. Great numbers of owners of feet will soon be sadly in need of dollars.

## THE MINES.

Buel & Co's Mill appears to be particularly busy, and is turning out large quantities of bullion. In addition to the ore from the Yankee Blade and Union No. 2, alluded to in our last, as worked at this mill, the *Reveille*, of a later date, contains the following:—

On Wednesday the 2nd inst., there was shipped from Buell & Co's mill, 1,030 ounces of bullion, the yield of nine and a half tons of Yankee Blade rock; and 437 ounces from three tons of Union No. 2. This bullion was worth about \$1 30 per ounce.

On the 11th inst. a brick, weighing 200 ounces, was received in Virginia City, the product of a small crushing from the Manhattan Company.

We clip the following items from the *Reveille* of the 5th inst.

The Austria is selling at \$12 to \$15 per foot; the Zouave at \$15 to \$20, and Golden Era at \$20 to \$30.

Ario ledge, near North American, is 150 feet wide on the surface, and assays \$3,000 to the ton.

Eclipse rock, 14 feet below the surface, presents numerous flakes of native silver, with other forms of the precious stuff. The ledge is three feet wide and rapidly improving.

Sada Redfern is the name of a new discovery, made just above Paul street; ledge three feet wide, and rich. They came on it while digging post holes.

Vineyard ledge, a new discovery, has created much excitement recently. It is three feet wide and quite rich; extensions have been taken indefinitely.

Three pounds of Flora rock worked by hand process yielded over one ounce of pure silver.

We have seen quite a handsome button of silver from five pounds of rock of the Gen. Meade ledge, a new discovery at Big Creek. It was quite promising indeed. The shaft on the Josephine is down twenty feet, and a tunnel has been run to and through the ledge, which is twenty feet wide, and will work over \$200 in the mill. Canon City is still improving in a permanent manner.

MIND YOUR QUARTZ.—Owners of the Governor Moreton took a specimen of their waste rock last week and had it assayed. The result was \$295 50 to the ton in silver. The rock tried was a conglomerate casing of a dirty grey color, appearing for the world like old ashes. Hence we come to the gratifying conclusion that silver may be found here even in the dirt or mixed cases of ledges as well as in the quartz, and that it is best not to waste any quantity which will test so largely, no matter how indifferent it may look.

SANTA CLARA.—Considerable attention has been drawn towards mining operations in Santa Clara county. They are running the second tunnel in the Capitola claim, after having struck the lead in the old tunnel at a depth of fifty-seven feet. Several gentlemen from Copperopolis have recently visited locality, who represent the Capitola rock to correspond well with that taken from the mines at Copperopolis. The Company is in about sixty-five feet, and the indications are constantly improving. The stock is principally owned in San Jose. The claim is located about eleven miles from San Jose in a south-westerly direction, and one mile above the Ten Miles House, (Beatty's,) on the south side of Los Gatos creek:

THE PROVIDENCE COMPANY:—This company's mine is located in Nevada county, about two miles below Nevada City, on Deer creek—the third cleaning up, from their mill has been shown us, and consists of a gold bar worth seventeen hundred dollars. No assessments have been levied by this company; their mill and workings have all been paid for by the yield of the mine. Eight stamps are now to be added to their mill, making a total of sixteen. We are pleased to notice the prosperity of this company; as it proves that we have good mines near home, and shows us what good management can accomplish in quartz mining. We predict a dividend in a short time by this company.

## THE MINING SHARE MARKET.

The Mining Share Market has exhibited no peculiar features during the week. The depression, heretofore noticed, still continues, although a fair amount of business is reported in leading stocks.

Ophir has been dealt in to the extent of 156 shares at prices slightly improved from the closing rates of last week. The damage done to this mine by the recent cave has now been fully repaired, and the main shaft or incline, is the best in the Territory, having been much improved and enlarged. Work upon the rich seam in the lower gallery was recommenced on the tenth instant. Rich ore is still being extracted from the new vein. None of the rock from this vein has been sent to this city for working, as heretofore reported. The Company possesses every facility at their own mills for working anything which comes from the mine. The "cave" has been a fortunate circumstance for the Ophir. By it the Company gained a new and splendid incline, an improvement which the dilapidated condition of the old one would have soon rendered necessary, and in consequence a new vein was struck, which has more than paid all expenses, taking into consideration both the time lost and the cost of improvements.

Gold & Curry shares have met with an advance of fully \$600, over last week's sales. This advance is owing to the very satisfactory report of the Board of Directors who have recently visited the mine. Most important additions are now being made to this Company's mill, to meet the increasing demand of the mine upon the reduction works. Latest accounts are to the effect that two new boilers had just arrived, each 24 feet in length, and each weighing 7,270 pounds. Three more of the same size and weight are yet to arrive. All these boilers will be used to drive the new two-hundred-and-fifty horse power engine soon to be erected to drive the amalgamating apparatus in the company's mammoth mill. This new machinery will be put up in a new addition to the big mill, which addition will be of the same width as the old mill, and some seventy feet in length.

Savage shares have fallen off \$300 since our last quotations, with light transactions. The market closed, however, with decided indications of an early improvement.

Hale & Norcross have slightly declined with light sales. The mine of this company will soon be in a condition for doing a good business, upon which a decided improvement in its shares may be expected. They have now a double shaft 300 feet deep from which they are raising from 30 to 40 tons per day. They will soon be able to raise a much larger quantity. Two mills are now employed crushing the ore from this mine.

Yellow Jacket shares have been much in favor and readily command \$1,050. Holders, however, are firm, and do not care to part with their stock.

Daney shares have met with large sales; 510 having changed hands, at fluctuating prices.

Burning Moscow fluctuated from \$120 to \$135, with a large business, 322 shares having changed hands during the week.

The Mexican Company, since the "cave" has put three new shafts down to the depth of 127 feet at which point they have been compelled to stop on account of water, and will not be able to sink further until they get their engine in operation. They will go down 250 feet before drifting to the ledge. This shaft is one of the best in the Territory, and is divided into three compartments. This Company has but 100 feet of ground, yet they have raised some of the richest ore found in the Territory. The Company has no stock in the market, but its shares are valued at a fabulous price.

The stock of the Mexican Company, No. 2, is beginning to attract some attention. The company has a shaft of 80 feet which has just cut a five feet ledge. The rock looks promising: The shaft makes about 60,000 gallons of water per day, which is kept down with a pump. This stock is quoted at \$35.

The Belvidere Company has recently sold out its original shaft to the Choller Company. Since the sale they have moved east about 100 feet, and sunk another shaft upon unclaimed ground, in which they have struck another vein from which they are now taking out pay rock.

The Sierra Nevada Company is located upon the south side of Cedar Hill. The works of this Company have been

quite recently commenced, with very flattering prospects, and they have done a very large amount of work for the time in which they have been engaged. We shall speak more fully of their work, in our next issue. The stock of this company is in good repute.

Overman shares which last week advanced from \$475 to \$600, have declined to \$475, with a weak market.

Baltic has fluctuated with large transactions.

Esmeralda shares have been rather more active than usual, the last week.

Wide West has met with a further decline, 230 shares having changed hands at from \$71 to \$85.

Real del Monte has further improved and is now quoted at \$425.

Silver Hill has slightly improved, with much enquiry.

In Pond quite large transactions are reported at speculative rates. Opening at \$55, it suddenly advanced to \$100. The losing offers are \$200 bid and \$250 asked, without sales. The bears appear to have it all their own way in this stock.

#### COPPER.

The Atlantic papers, in view of the rapidly increasing shipments, actual and prospective, of copper ore from this to Eastern ports, are beginning to discuss the possibility that the receipts may soon exceed the capacity of the smelting works. A writer in a New York paper, however, sets the matter at rest, by showing, very definitely, that the works at Boston and New York, alone, are quite equal to meet any calls that may be made upon them for some time to come. New York, it is argued, should provide such facilities as should render that point the center of this growing traffic.

Stocks in well developed copper mines are held firmly and will doubtless soon become as desirable for investment as those of a similar class are in New York, Boston or London. In those cities they rank, for reliableness, with bank stocks, and in the latter a copper mine yielding an average of 8 per cent. ore, fully developed would rate at about \$2,000 per foot. Should one be found there coming up to the California standard, of first class mines, of about 20 per cent, its value would be reckoned at an almost fabulous price. Capitalists, in this State, are as yet slow to appreciate the value of a well developed and reliable copper mine. One promising mine of copper, even yet in the infancy of its development, is worth a score of the ordinary gold and silver schemes in the ocean of bubbles now floating on the market.

Napoleon has met with an important advance, opening at \$36 and closing at \$90 with \$95 asked. This improvement is owing to very favorable reports from the mine.

The principle sales of the week have been made at figures of made public. A number of our prominent business men have been the purchasers. At 193 feet the lode is exceedingly rich; width estimated at 25 feet at that depth with 5 to 6 feet of concentrated ore. The works are being enlarged rapidly; shipments rising 200 tons per month. Ore is being used from 165 feet in depth. 35 men are at work night and day.

Several tons of ore from the Aroyo Seco claim, in Amador county, have arrived in this city, the past week—the first shipment from that mine. By the same arrival came twenty-six tons of ore from the Newton mine.

The Pioneer Company's mine, a short distance below Uniontown, El Dorado county, is beginning to attract some attention. This mine, besides giving a high assay of copper, is said to return a very large yield of gold.

A small shipment of ore, the first we believe from the mine, was received in this city from the Washington Ledge at Cloverdale, in Sonora County, a few days since. The ore was taken from a shaft only six feet from the surface, which promises a still farther and plentiful yield of the same.

Our neighbors in Oregon are becoming quite excited about "feet," among which copper feet are taking a prominent position. The latest reported discovery in that region is on the John Day river, and 80 per cent. is claimed for the average of a number of assays. It is said that \$5 cost of transportation per ton, will place the ore within reach of steam communication with this city.

OUR VIRGINIA CITY CORRESPONDENCE.—We have made arrangements with an able correspondent at Virginia City, and shall commence the publication of his letters in our next issue.

REESE RIVER CURRENCY.—Our Reese River friends are much troubled by reason of a great scarcity of small change. To remedy this evil a business firm at Austin purposes to establish a bank for the issue of small "promises to pay." Another firm purposes to stamp small bars of silver and issue them as currency. We think the metallic basis will win.

#### REPORT OF BIDS

At the San Francisco Mining Stock Board,  
For the week ending Sep. 19, 1893.

Names of Companies.	Total No. Shares.	Shares per Cent.	Bar Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.

## COPPER AND COAL AT ANTIOCH.

Mr. Editor:—In response to your suggestion that some difficulty has still to be removed in the combustion of Monte Diablo coal at Antioch, allow me to say that the mode of feeding a furnace with gaseous combustibles mentioned in connection with the Norwegian mode of treating copper sulphurets in my letter of the 3d inst., can be adapted to any sort of fuel; and, in what I consider its most perfect form, can be employed even where the greatest heat is required and with a flame of any chemical character desired in metallurgy; and this with economy in stoking. A form of grate which has been of much service with coal of similar properties to the Monte Diablo, is that termed the "Step Grate"—deep furnace bars are laid, stair fashion, *ie.*, their flat sides upwards, sufficiently overlapping to prevent the cinders from falling through, and sufficiently raised to admit air where the risers would stand in a stair-case.

I have working drawings of some of these furnaces. A POOR CHEMIST.  
San Francisco, Sept. 17, 1863.

NEW MINING OFFICE.—Messrs. W. P. Denckla and A. L. Chamberlin have a newly arranged Office, in the commodious store, No. 418 Montgomery Street, for the purpose of transacting a general mining business. Mr. Denckla was unanimously elected Vice President of the new Board of Brokers recently organized in this city. We have never measured Mr. Denckla's whiskers, neither the girth of his waist, and we do not know his weight (as the *Alta* seems to have determined in the case of the worthy President of the old Board of Brokers) yet we think Mr. Denckla worthy of the confidence of the mining community. Mr. Chamberlin is a man of gentlemanly and pleasing ways.

SEMINARY FOR YOUNG LADIES.—Miss Butler, late of the Chestnut Street Female Seminary, Philadelphia, is about to open a School for Young Ladies, in this City. Miss Butler is said to possess intellectual attainments of a high order. We bespeak for her a liberal patronage.

STATE AGRICULTURAL FAIR.—The State Agricultural Fair at Sacramento, will commence September 25th and end October 2nd. Our thanks are due to I. N. Hoag, the gentlemanly Secretary, for a Complimentary Ticket.

## MINING LAWS AND FORMS

JUST PUBLISHED BY H. H. BANCROFT & CO., being a compilation of the Statutes of this State relating to Mining Corporations, Assessments, etc., with a digest of decisions of the Supreme Court and Forms for the Incorporation of Companies. ## GENERAL NOTICES.

DR. H. AUSTIN,  
DENTIST,

No. 634 Washington street,

Between Montgomery and Kearny, (over San Francisco Baths.)

I have recently received from London a New and Beautiful Vulcure (India Rubber) for Artificial Teeth, which is far superior to any other ever used. It is light, clean and durable, and of a natural color. The cheapest and best material for temporary (and in many cases) permanent sets. All operations thoroughly performed, and at reasonable prices. je-29

## New Patent Agency.

WE HAVE CONNECTED WITH THE  
Publication of the "MINING AND SCIENTIFIC PRESS"  
The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

Mining and Scientific Press Agency  
The most desirable place to make application for Letters Patent on the Pacific coast. Apply at  
Office of the "Mining and Scientific Press," Room No. 67, Government House, corner of Washington and Sansome streets, San Francisco. EWER & SMITH.

## FOREIGN PATENTS OBTAINED

By application at this office, Room 27, Government House, EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 67, Government House. Terms moderate. EWER & SMITH.

## PATENT RIGHTS.

Patent Rights Bought and Sold,  
At the office of the "Mining and Scientific Press" Agency  
EWER & SMITH.

## IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors. EWER & SMITH.

## WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 5016-1f ZENAS WHEELER.

PUMPS!

HARRISON'S

California Lift and Force Pump,  
WITHOUT VALVES OR PACKING,

Suitable for Mines, Fire Engines, Irrigating,  
etc. This is the Cheapest, Lightest and most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

ALL SIZES;

capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute—For sale by

G. H. HARRISON,

PHOENIX OIL WORKS,

Je 16 517 Front Street, San Francisco,

50 lbs. MARINE and

Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for Hulls and Decks of Vessels  
on ground. Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
Bottoms of Ships, it is equal to a coat of Stone, and  
quite equal to Copper, no worms will ever effect it, and  
cheaper than any other paint.

DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur,  
two parts Mineral Paint, mix with Coal Tar and apply  
hot.

For sale by all Ship Chandlers and Tradesmen, in boxes  
50 lbs. each, or by the Pacific Metallurgical Works.

25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal  
covering them with a coat of Stone, being perfectly  
re-Proof, and costing less than any paint.

DIRECTIONS:

HOUSE.—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil: if a lighter color is  
desired, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white  
lead; mix with Linseed oil. Put it thick on a tin Roof  
one coat when properly applied will last three years.

GOOD DIVIDEND.—The Jefferson Quartz  
Mining Company, at Brown's Valley, twelve  
miles above Marysville, on the Yuba River,  
(lately known as Snyder & Frazier,) declared  
a dividend on Monday of \$1,000 per share to  
five shares, for the previous fortnight's run of  
their mill. That is fully equal to Gould &  
Curry.

This mill recently took out, the result of  
eight day's crushing, 218 65.100 ounces of  
gold, worth about \$5,414. In the same time  
they exhausted about one hundred tons of pay-  
rock which is now ready to crush.

COVERING ARMOR PLATES WITH GLASS.—

The whole of the armor plates of the British  
cupola ship *Royal Sovereign* are to be covered  
with a vitreous sheathing, which consist of a  
surface of glass based upon small plates of  
iron, sufficiently thin to be to a certain extent  
flexible, which are applied to the ship by a  
new adhesive process, and have been ascer-  
tained to be capable of resisting all ordinary  
contingencies from pressure or abrasion. The  
cost is 1s. 7d. per square foot.

STOCKINGS "to suit the feet" are now sold  
in London. They are, like shoes, "rights  
and lefts." The inner edge of each is quite  
straight to the extremity of the great toe,  
while the outer is rounded off to the shape of  
the foot.

Eye, Ear and Throat.

DR. DE CASTRO,

Oculist and Aurist,

WHO HAS PRACTICED IN NEW  
York and all the principal cities of Europe with  
such unrivalled success, and from each place is in pos-  
session of the most eminent testimonials, may now be con-  
sulted upon diseases of these delicate organs, with a view  
to their permanent cure. Deafness of long standing tho-  
roughly cured. The Doctor employs his (by the Medical  
Society of London approved)

Self-adjusting Artificial Tympanum,

For the relief of deafness, attended by loss or injury of  
the membrana tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of  
the paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state; the effect of the tympanum was instantaneous—  
quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

Mr. Editor.—Having been afflicted  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it is with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to recom-  
mend Dr. De Castro's skill as an aurist.

JOHN REESE, Napa Valley.

James Callaghan, witness.

San Francisco, July 30th, 1863.

[From the Daily Alta.]

San Francisco, June 30th., 1863.

DR. DE CASTRO'S ALTA:  
Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearny and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly; and is now, I am happy to state in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skilful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.

## MINING NOTICES.

**Wide West Copper Mining Company, Office,** 528 Montgomery street, San Francisco, September 10, 1863.—Notice is hereby given that an assessment of Twenty-five cents was this day levied on each and every share of the capital stock of the Wide West Copper Mining Company, and payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, or to J. M. Pike, Superintendent, at Copperopolis.

By order of the Board of Trustees,  
sep14 M. G. ELMORE, Secretary.

**Bald Eagle Gold Mining Company,** Gold Flat District, Nevada County, Cal.—Notice is hereby given that a assessment of Twenty five cents per share has this day, (September 9th 1863.) been levied by the Board of Trustees on the Assessable Stock of the above named company, and payable immediately in United States Gold Coin to the Secretary at his office, or to T. S. Smith, Superintendent, Grass Valley, Nevada Co.

By order of the Trustees,  
P. L. BIBBINS, Secretary, 105 Montgomery Street.  
sep13m

**Winona Gold and Silver Mining Company**—The first annual meeting of the stockholders of the Winona Gold and Silver Mining Company, will be held at the Company's office, No. 426 Montgomery street, for the election of five Trustees for the ensuing year, on the 19th day of September, 1863, at 7 1/2 p. m. By order of the Board of Trustees, M. G. ELMORE, Sec'y.  
aug24

**Red Jacket Mining Company.**—At a meeting of the Board of Trustees of the above company held July 7, 1863, the first assessment of Five Cents per share on the capital stock was levied, payable immediately in United States gold coin, to the Secretary, office 420 Montgomery street, Room No. 2. By order of the Board.  
aug24 J. W. CROSLY, Secretary.

**Office Table Mountain Copper Mining Company.**—Notice is hereby given that the Board of Trustees of this Company, held July 25, 1863, an assessment of Thirty Cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin to the Secretary, at the office of the Company, No. 528 Montgomery street, or to J. M. Pike, Superintendent, at Copperopolis. M. G. ELMORE, Secretary.  
aug24

**Office of the Niagara Consolidated Gold and Silver Mining Company,** El Dorado Canon.—Notice is hereby given that the Board of Trustees have this day levied an assessment of Twenty-five Cents per share upon each and every share of the capital stock of the said Company, payable in U. S. gold coin immediately to the Secretary, at the office of the Company, No. 528 Montgomery street, or to the Contractor at the Canon.

M. G. ELMORE, Secretary.  
San Francisco, July 20, 1863.  
aug24

**AGENTS WANTED.**  
We want a good Agent in every city, town and settlement, on this Coast. Applicants will send their names with reference, when specimen numbers of the **Mining & Scientific Press** will be forwarded to them, and their names added to our published "List of Agents."  
EWER & SMITH.

**Utica Gold & Silver Mining Company,** Office, 528 Montgomery Street, San Francisco, Sept. 18, 1863.

Notice is hereby given, that in accordance with the laws of the State of California, and the resolution adopted by the Board of Trustees of the Utica Gold and Silver Mining Company, Esmeralda District, there will be sold at Public Auction, at the Office of the Company of Friday October 23, 1863, at 10 o'clock A. M., so many delinquent Shares of the Capital Stock of the Utica Gold & Silver Mining Company, standing in the names of the following named persons, as will be necessary for the payment of the assessment of ten cents per share, levied June 12, 1863, and two dollars per share levied August 10, 1863, together with cost of advertisements and expense of sale, unless said assessments with accruing charges are previously paid:

Names.	Certificates.	Shares.	Amount.
L. B. Lott, No.	7,	20,	42.00.

J. Kausler, "	69,	5,	10.00.
	G. L. WALRATH, Secretary.	1m	

San Francisco, Sept. 18, 1863.

## TO QUARTZ MINERS.

All persons interested in Mining Machinery are invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured.

sep21 THOMAS VARNEY.

## MINING CARDS.

**ALEXANDER STOTT,**  
MINING SECRETARY,  
512 Sansome Street, San Francisco.

Secretary of—  
Horse Shoe, Silver and Copper, Monte Diablo.  
DANIEL WEBSTER, Gold and Silver, Devil's Gate.  
GENERAL JACKSON, Gold and Silver, Devil's Gate.  
FIGARO, Gold and Silver, Alpine District. au10

**MINING & SCIENTIFIC PRESS.**

**THE ONLY MINING, MECHANICAL AND**  
SCIENTIFIC PAPER ON THE  
CONTINENT.

**THIRD YEAR! VOLUME VI.—NEW SERIES**

A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that over  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

**The Mining Interest!**

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Mi-  
ning Stocks, new inventions of Machinery adapted to the  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

**The Inventor!**

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having long  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patent  
with dispatch.

**The Mechanic and Manufacturer!**

Will be greatly benefitted by its perusal, as its co-  
lums will from time to time contain original engra-  
vings of new machines and inventions, together with  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest  
our readers.

**To Chemists, Architects and Millwrights**  
This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of in-  
formation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will not be neglected, engravings will be given  
agricultural implements, and the farming interest ge-  
nerally will be amply discussed.

## Terms.

To mail subscribers:—Four Dollars per annum;

**Club Rates.**

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Names can be sent in at different times and for  
different Post-offices. Specimen copies will be set  
gratis to any part of the country.

**EWER & SMITH, Publishers,**  
Room 57, Government House, Corner of Washing-  
ton and Sansome streets, San Francisco.

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, SEPTEMBER 28, 1863. NO. 48.

## REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

## A Mammoth Project for supplying Virginia City with Pure Water.

The problem of how best and soonest to supply Virginia city with pure water, is exciting much interest there at this time. The *Enterprise* gives a lengthy report upon the subject from Engineer Ostrom made to the company, which has undertaken the enterprise, from which we gather the following facts:

It is proposed to collect the water from several small mountain streams to the northward and westward of Washoe Lake and bring the water so collected into Virginia. To do this, it is necessary to convey the same across a valley a distance of six miles, the lowest depression of which is 1200 feet below the required level at which the valley must be crossed to reach Virginia City. To do this one of two methods must be adopted—either to pump this water up to an elevation of 1,200 feet by machinery, or to carry it across the depression in iron pipes. Ordinary cast iron pipes will not stand the pressure; hence boiler iron must be used. The pressure at the great depression will be 651 lbs to the square inch, which is equivalent to a pressure in a 42-inch boiler of 235 lbs. The pipe at this point will have to be half an inch thick. But as this pressure will only extend for a quarter of a mile, it is estimated, that an average of one quarter of an inch throughout the entire distance will be ample. This will make the amount of weight of iron to be used—32,000 feet of 15-inch pipe, half an inch thick—within a fraction of 630 tons; which at 15 cents per lb will give \$191,700 as its cost. The entire cost of the work together with service pipe laid through the city is estimated at \$497,000. The supply furnished will be 3,000,000 gallons per each 24 hours.

**THE ACID WORKS.**—The Carson *Independent* announces the starting of the Acid Works in that locality as follows:

The acid works are completed, and have commenced work. Everything works to the satisfaction of the proprietors, and in a few days they will be able to supply the Territory with sulphuric acid at much less cost than the imported article. Our mill men should encourage all enterprises of the kind, as they go to make up the wealth of the Territory.

It is the intention of the proprietors if they meet with proper encouragement, to enlarge the works so as to manufacture all the chemicals now used in the process of reducing the precious metals.

## THE GROSCH COMPANY.

This mammoth incubus will not go down at the bidding, but still threatens to prove a formidable cloud on the title of some of the leading mines on the Comstock lode. It would seem as though the lawyers of California were the busiest, and most subtle of all created humans. It is almost if not an utter impossibility to so perfect a title or enact a law that a California lawyer will not rend in shreds by the force of his logic or the skill of his cunning. It may be that they are one of the necessary evils of the land, and that we cannot do without them. If we could have it our own way, however, we would try it for a while, anyhow, and if the experiment proved a failure would endeavor to put up with the infliction with the best grace possible. It is our honest opinion, that a commission might be devised, for every mining district, where nine-tenths of all mining disputes might be fairly and equitably settled without the intervention of any other lawyer than the commissioner upon the Bench, who, of course should be a man of probity and standing, especially selected for his wisdom and prudence, and appointed—not elected—to hold office during good behavior.

But we have almost lost sight of the item on which we started, the Grosch Company, which has just issued a pamphlet of twenty pages, setting forth the ground of their claim to three-fourths of 3,750 feet on the Comstock ledge. This claim will afford most excellent pickings for the *coterie* of lawyers who, no doubt were the getters up of the scheme for the simple purpose of levying black mail upon some of our wealthy companies. The companies, however, seem to regard it, apparently with very little concern, and declare themselves in possession of evidence that cannot fail to overthrow it entirely. The claim covers the following subdivisions of the Comstock ledge:

Gould & Curry	1200 feet.
Best & Belcher	225 "
Dick Sides	500 "
White & Murphy	210 "
Kenney	60 "
Central No. 2	150 "
California	300 "
Central No. 1	150 "
South Ophir	200 "
Mexican	100 "
North Ophir	655 "

Together with the net profits arising therefrom since the occupation by others.

**FORREST HOME.**—Considerable interest is being taken in copper mines at and near Forrest Home, Amador county. The "Exchange Company" has recently been incorporated, and are now prosecuting the work upon their vein with energy. At a depth of thirty feet the vein presents most excellent indications, showing a five foot lode interstratified with three distinct veins of sulphur ts, which present unmistakable indications of soon concentrating in a heavy lode. The secretary of this company, Mr. N. King, has left a fine specimen of ore at this office, taken from the mine, and weighing some 50 pounds. They have a large quantity of ore already on the surface, and are about preparing the same for shipment. We hope soon to report this among the ore-shipping mines of that district. The Exchange is located about two and a half miles southerly from the Oriental and Cosumnes mines.

## SPECIMENS FROM EL PASO.

We neglected in our last issue, to acknowledge the reception of a box of specimens from El Paso, the new mining district on the road from Los Angeles to Slate Range, the locality from whence the letters, recently published over the signature of "C. W. T." were written. This is evidently destined, at an early day to become an important mining locality. The specimens which we have received, all present similar characteristics, and are quite unlike any which occur at any point to the Northward. The chief value of these ores, we presume, consists in silver. Gold, we believe, occurs to some extent, and nearly every specimen in the collection before us presents strong indications of copper. Among the companies represented, we notice the Eureka, Garibaldi, Comet, Tucker, Gov. Downey, Laurel, Gau, Milliken, McClellan, Morning Star, Ben. Lohmond, Manzanillo, Narboe No. 2, Newport, Molino del Rey, Boston, Orizaba, and Maine.

Persons interested or curious in the mines of this region are invited to call and examine these specimens.

**A SIMPLE MACHINE FOR MAKING ICE.**—All Paris has recently been rejoicing greatly over a recent discovery for manufacturing ice in a cheap and simple manner, so cheap and simple as to place the entire process within the means of every housekeeper. The machine is described as follows:

"A cylinder of metal—tin will answer—with a movable cover at one end, to be kept tightly in its place by a screw when shut; with two openings one at each end, to receive through two funnels the materials used; and a discharge cock at one end, to discharge the contents when the cylinder is to be emptied, is all the apparatus required. This cylinder, when properly charged, is placed on a pair of rockers, so that a see-saw motion may be obtained. To convert five hundred French grammes of water into ice (each gramme being nearly seventeen grains avoirdupois) it is necessary only to place in this cylinder or well twelve hundred grammes of sulphate of soda and eight hundred grammes of hydrochloride or muriatic acid. Into this preparation or bath, says the inventor, place a form or vessel containing the water to be frozen, a bottle of champagne to be frapped, or any other material required to be frozen. Close the cover, screw it fast, and then for seven or eight minutes give the cylinder or well a see-saw motion on its cradle, and you obtain the desired result. A solid block of ice of five hundred grammes may be produced by this operation."

"All Paris, has been running to see the machine at the Rue de l'Arbe, Sec. No. 60, where its effects are publicly exhibited. These machines are rapidly sold at from fifty francs to one hundred and twenty, according to the size. A late number of the pictorial paper *L'Illustration* gives a drawing and a description sufficiently intelligible to enable any of our metal workers to manufacture them. If we may believe the half of what is said, our dependence for cold drinks will no longer be upon the icemen, but on the chemists."

**WASHOE TO BE REPRESENTED AT THE WORLD'S FAIR.**—Almarin B. Paul, Esq., is collecting a valuable set of specimens, to represent the mineral wealth of Nevada Territory, in the approaching World's Fair at Paris. Mr. Paul has probably contributed more than any other individual toward the development of that region. He was one of the earliest pioneers in Washoe and has devoted his entire energies, both pecuniarily and mentally, towards its development. He is deserving of much credit for his efforts in that direction.

THE HUMBOLDT MINES.

For some reason or other the Humboldt mines appear to be in a measure lost sight of by newspaper correspondents, of late. The Humboldt Register, however, assures us that the mines have neither "dried up" nor are they deserted. But little prospecting, according to that paper, seems to be going on at the present time, but all the old companies are "plodding quietly along, getting in their assessments as quietly as possible, and putting in good solid blows and blasts. This," adds the Register, "is all right. It will bring the country out in proper light ultimately, though all looks tedious at present."

The Register further says:

We did hope, that capitalists who put in so liberally for feet would do something in the way of providing means of separating our metals, and thus show the world what these mountains of ore are worth. It would have helped the miners, and would have been a much shorter road for capitalists, to the immense fortunes destined to be worked out of the silver lodes. It would be the shorter road now. Enough is shown to attest beyond cavil the unprecedented richness of the Humboldt mines. But the air line has taken elsewhere the capital that should be this have built mills for us. Wind work has told for other localities, and we must work patiently on with the few mills we have—trusting to quiet industry to establish for us what speculative gas claims all for other sections."

The Register gives full reports of the progress of operations in the several districts, from which it would appear that the miners themselves are not at all discouraged at the present cloud which hangs over that region. We condense:—

STAR DISTRICT.—No accounts save that all the companies of that district are pushing ahead with their work.

BUENA VISTA DISTRICT.—Companies all at work. Cincinnati, the largest tunnel in that region in 300 feet. Sargent pushing on their tunnel night and day. Buckeye, ditto; in 110 feet. Anderson in 70 feet, with a well defined and good looking ledge. National & Downey, Cedar Hill, going ahead.

The "Monitowoc," have pushed their tunnel to the distance of 100 feet. This is one of the most promising ledges in the district. We have assays of rock from this ledge before us, as we write, made in this city, which read as follows:

Average assay of 14 sacks of Monitowoc, \$525 35 to the ton of 2,000 lbs.

Another informs us that 3,300 lbs. of rock from this mine worked by Bradshaw & Co. of this city yielded at the rate of \$525 to the ton.

Another assay yielded \$1,417 89 in silver; and still another \$328 52 in silver and \$33 11 in gold.

Assays in Unionville have been made as high as \$3,000.

With such indications we should suppose the company might go on with the greatest confidence in developing their mine.

SACRAMENTO DISTRICT.—A correspondent of the Register pronounces this one of the richest districts in the region.

The Cosumnes are driving in a very extensive tunnel, working night and day. The Howard, Iowa, Mary Stephens, Tehama, Sebastopol and many other promising claims are included in this district. The correspondent alluded to says:

"The best indications of silver ledges (the black and brown traces) are more fully shown here than in any other district yet discovered. It is remarkable that so few miners or prospectors are neither geologists or mineralogists, but merely visionists; they seem to run astray after the green and blue sulphurets or stains for rich mineral indications—a most fatal error."

SIERRA DISTRICT.—The Sierra District is also thriving. The Croesus is hauling some very rich rock to the Sheba mill. The result will soon be known. The Natches is still pushing on their tunnel. Empire Tunnel Company is taking out rock and having it worked at Fall's mill. The Eclipse Tunnel is being pushed on vigorously under Charley Barber's supervision. The Neptune Series, Gideon Band Series, Monroe Series and numerous other Companies are actively pushing forward the work of development.

TRINITY DISTRICT.—This is comparatively a new district—inhabitable, sandy, salty, saggy, full of alkali and good in nothing unless it be mines; in this particular the Trinity folks think they have "got it." The Evening Star Company are taking out rock, and sacking it to send to Virginia City to be worked—considered rich in both gold and silver. The St. Charles Co., Keystone, Texas, Pennsylvania, etc., are all promising ledges, and located in this district.

ESMERALDA.

Probably no mining camp east or west of the Sierra Nevada has suffered more, proportionally, from law suits and the general dilatory proceedings of the Courts, than Aurora city. The calendar of her District Court has been for some time overflowing with complicated and confused litigation, the result, according to the Times, of judicial inertia. The recent boundary survey having proved that the mines, or at least four-fifths of them are outside of the limits of the State of California and her courts, has apparently dissolved numerous injunction suites, and, by a sort of tacit common consent, the several companies have again resumed work upon their claims. The Pond company have put four shifts of hands to work, Real del Monte and other companies have also gone to work again, and the camp is assuming quite an unwonted degree of activity. The wages paid to the laborer will enable him to pay his obligations and the boarding man or merchant will receive his demands in gold, which shows the beneficial effect, active employed labor has upon the whole community, and no branch of trade or business can fail to be effected beneficially thereby.

The Times is very properly jubilant over the new condition of things and asserts that the ledges of that district only need to be worked to realize the most sanguine expectations. It claims that the Del Monte company, to-day, works as rich a ledge and as lasting as ever poured bullion into the lap of enterprise from any quarter—Virginia, Gold Hill, or any place else. It furthermore says:—

"We have an abundance of rock which pays all the way from fifty to two hundred dollars per ton and upwards; and will they tell us that our mines are of no value? If stocks are down, what of it? Some capitalists have faith sufficient to erect mills of great value among us, and they believe they will be remunerated. Mr. Fogus has just completed his mill. The Real del Monte will before long, have their mill done. The Antelope Company is putting up a large mill. To those who would condemn us, we would say, suspend your judgement for a while—let our new mills get under way. Let them add their yield to that of those now running, and after a fair test, if our mines will not pay, give your verdict against them. Till then you should not say ought against us."

THE MINES.

The Times notices four good sized "bricks," valued at \$18,363, the yield of 164 tons of rock from the Aurora ledge, of the Real del Monte Consolidation—\$112 to the ton, crushed, we presume, at Fogus' mill. That comes up to Comstock, and with sundry yields from other ledges, which we give below, affords pretty good evidence that Esmeralda is very far from being a failure.

The Real del Monte mill, one of the finest and most complete on the Western Slope, will commence running about the middle of November, after which time the Company will be able to crush their own rock. They now have a contract for the delivery of 10,000 tons of rock at their mill at the rate of 40 tons per day. It is estimated that the rock last crushed is a fair average of what is to come. A pretty good prospect for one Company. We look for a rapid increase of Bullion Shipments from this Camp from this time out.

Mr. Fogus has completed his mill; it went into operation on the 9th inst. The mill has 12 stamps, 8 Wheeler pans, and 3 separators. The machinery is well arranged. Mr. F. is to crush for the Real del Monte Consolidation.

The Crockett has now fairly tested their ledge and have proved by practical demonstration that it is valuable. They recently cleaned up \$8,000 as the result of one week's run. After paying all expenses, they were enabled to declare a dividend of \$5 to the foot. They have a shaft down 180 ft., and are working night and day.

The Seymour Company recently cleaned up \$1,400 from 10 tons of rock. This Company has also been enabled to declare a dividend. Their shaft is down to the depth of 60 feet. The claim is pronounced valuable.

The Clan Alpine is being worked with two sets of hands. The Company intend to take out at least fifty tons of rock for their next crushing. The rock is thought by the Company to be improving. The deeper they sink the richer it is. That is a fine characteristic.

The Maggy Green Company is situated on Silver Hill, near the Utah. It is reported the Company recently struck very rich rock. The ore resembles the Utah, and is said to be equally as rich.

The Clan Alpine has recently had a crushing with the most satisfactory results. We expect to hear of another crushing soon. Their ledge improves as they go down.

The Pocasset are about having some of their rock crushed. They take it to the mill in sacks. The Lady Kate are finding good looking rock. It is much decomposed and show well in silver as well as gold.

The Western Summit, we believe, are not doing much at the present time. This is an incorporated Company, with its business office in this city. The Company has a conflicting claim with Ural, which the Times explains as follows:—

"The Western Summit claim twelve hundred feet; the Ural four hundred feet, supposed to be the same lode. Now, if the Ural should succeed in maintaining the claim to the four hundred feet, there will yet be left to the Western Summit eight hundred feet of the best and richest, or rather one of the best and richest claims in the District. We also learn that both mines are well opened, and can be worked expeditiously.

The Siam is located about midway between the base and summit of "Middle Hill. The Company have incorporated and located their office in this city. The ledge is about three feet wide, and they are sanguine of opening a rich mine.

The "Kinderhook," another very fine ledge is located in the same vicinity. A shaft is now being sunk on the ledge with very flattering prospects.

The Magdalena, under the superintendence of Mr. Robert Howland, are very nearly up to their ledge.

The accounts from the Bodie District are very encouraging; extravagant anticipations are indulged in, the proof of which, it is claimed is a mere matter of time.

Tunneling operations, which constitute an important feature of this locality are progressing most satisfactorily.

[From an Occasional Correspondent.]

SILVER CITY, OAK RUN DISTRICT,  
SHASTA COUNTY, SEPT. 4, 1863.

This new land of silver and gold was unknown in the mineral world until last spring. At that time a few lodes were discovered on Pitt River; this led to more extensive prospecting. Ledges were traced for many miles; a number of mining districts were formed and minerals were found in great abundance. But at that time little was known of their value. The next step, of course, was to ascertain, by assays something of the character and value of the minerals. It was found that lead exceeded in quantity but that silver exceeded in value. The highest assay yet known is from the Keyoma ledge; this has assayed over \$7,000 per ton in gold and silver; other ledges have assayed from \$50 to \$211 per ton in silver. Among these may be named the Silver Creek, General Jackson, North Star, Coon Creek, Sugar Pine, Buckhorn and Union, besides many others of established richness. The mines now present a lively appearance. Many visitors are now there prospecting, or investing small amounts, thereby securing to themselves a portion of the wealth which the labors of others have opened to the world. Cabins are being built, which shows that some are intending to winter in the mines. On most of the lodes above mentioned, work is now going on, shafts or tunnels commenced and rock is being taken out. Some companies on the best lodes are intending soon to forward quantities of rock to San Francisco, calculating on large profits, even after paying freight and the high price for working rock in that city. Will regard to the geography of the country, it is very heavily timbered with pine, fir, oak and cedar, all commingling in dense forest, save where it is too precipitous and rocky for timber to grow. Coal of fine quality exists in great abundance. Geologically it is like all other mineral countries; the predominating rocks are primary limestone, greywacke slate of various kinds, granite, quartz &c., and all is upheaved from its original horizontal position and stands at a dip of thirty to forty degrees. The mineral veins or ledges are interstratified with the rocks, are generally well defined and from four inches to eighty feet in thickness. The mineral veins run N. W. and S. E., and across these, at right angles with them, are numerous creeks, some of which have worn down 50 to 80 feet upon the different ledges, thus having done the work of opening the claims, leaving the "pay rock" exposed for immediate work.

C. P.

A RICH MINE.—The Allison Ranch Mining Company, for a crushing of 24 hours, one day, recently, took out 500 ounces of gold.

New Style of Ladies' Buckle!

W. BOHM,

INVENTOR AND PATENTEE.

THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the  
construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
excels several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
Excels all other buckles in  
**Usefulness, Strength and Appearance.**  
The Public is respectfully invited to call and examine  
this Buckle at the Jewelry Establishment of  
BRAVERMAN & LEVY,  
621 Washington Street, San Francisco.  
JOSEPH, BROTHERS,  
607 Montgomery Street, San Francisco.

# THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to  
combine all the improvements which the experience of  
the past has afforded. They have been

EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent. more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1860, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cut in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.

TAY, BROOKS & BACKUS.

UNIFORMITY IN NAMES OF MINING COMPAN-  
IES.—That a great evil is being inflicted upon  
us, as a mining community, in the similar-  
ity of names adopted by our incorporated  
Mining Companies, is patent to every one.  
No sooner is a company incorporated and in  
successful tide of operation, with its stock  
holding a value in the market, than the same  
name is adopted by half a dozen other com-  
panies in some other and perhaps a neigh-  
boring district. If this practice is continued  
it will result in a perfect babel of confusion.  
The practice should be reformed, altogether.  
As a check to this evil why should not some  
prosperous company whose name has thus  
been "borrowed" serve an injunction against  
the use of their name? The evil is a grow-  
ing one and has already arrived at a magni-  
tude which calls for Legislative interference,  
if it cannot be otherwise remedied.

G. E. MOORE,  
Assayer and Analytical Chemist,

TO QUARTZ MINERS.

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centro and passes under it, between the grinding sur-  
faces, to the circumference; from whence it passes again  
over the muller to the centre, through the holes and be-  
tween the grinding surfaces to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an imalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the party infringing. My Amalgam-  
ators can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.

THOMAS VARNEY.

## THE MINERAL WEALTH OF WASHOE.

In considering the mineral wealth of Washoe, at this present writing, we wish to be understood as confining our remarks to a very small portion of the region known by that name. We would include Virginia City, Gold Hill, Silver City, Empire, Ophir and Dayton, embracing a parallelogram say of eight miles in length by two in width. The famous Comstock lead passes through this district, and furnishes the chief, but by no means the entire amount of the precious metals which is taken therefrom.

Perhaps the most reliable data from which to estimate the yield of this district, is that recently furnished the Territorial Enterprise by Wells, Fargo & Co's agent in Virginia City. From that data it appears that the following, expressed in round numbers, passed through that office during the period specified below:

For the quarter ending April 1, 1862,.....	\$ 270,000.
" " " " July 1, ".....	570,000.
" " " " Oct. 1, ".....	800,000.
" " " " Jan. 1, 1863,.....	956,000.
" " " " April 1, ".....	1,270,000.
" " " " July 1, ".....	1,600,000.

Total amount for the past eighteen months, \$5,466,000.

The rapid and uniform increase of the above amounts, from quarter to quarter, is perhaps the most interesting and suggestive idea connected therewith. No one at all familiar with the present rapid progress which is being made in the development of the mines in and about Virginia City can for a moment doubt but that the quarterly shipments will continue to gradually improve for many years to come. The same authority has set down the yield of the entire district, under present consideration, for the year 1863 as follows:

Virginia City,.....	6,900,000.
Silver City and Gold Hill,.....	10,000,000.
Empire, Ophir and Dayton,.....	8,000,000.
Add in excess for Virginia City,.....	1,000,000.

\$25,000,000.

For manifest reasons, which must fully appear in the actual returns of the two quarters of the present year already passed, we have added \$1,000,000 to the estimate for Virginia City, making the total estimated yield of 1863 foot up Twenty-five millions of dollars—a pretty good yield for a section of country embracing not more than thirty-six square miles. The next year will doubtless largely increase the amount.

The best evidence of the correctness of this estimate is the value at which the leading claims are held in this district. We append a list of the claims on the Comstock lead commencing with the Ophir and running south and including the Yellow Jacket, with the number of feet in each claim, and the market value of the same.

1. Ophir.....	1,400	\$2,500	\$3,600,000
2. Mexican.....	100	10,000	1,000,000
3. Central.....	150	1,500	250,000
4. California.....	300	1,700	510,000
5. Central No. 2.....	150	1,000	150,000
6. Kinney Ground.....	60	12,000	72,000
7. White & Murphy.....	210	700	147,000
8. Dick Sides.....	500	600	300,000
9. Best & Belcher.....	225	1,000	225,000
10. Gould & Curry.....	1,200	5,000	6,000,000
11. Savage.....	800	3,000	2,400,000
12. Hale & Norcross.....	400	1,700	680,000
13. Chollar or Potosi.....	1,400	1,000	1,400,000
14. Fairview or Bullion.....	1,200	1,500	1,800,000
15. Apple & Bates.....	10		
16. Omega S. M. Co.....	290		
17. Gold Hill Co. No. 1.....	300		
18. Gold Hill, No. 2.....	300		
19. Alpha G. H. M. Co.....	300		
20. Imperial S. M. Co.....	118		
21. Fairfax, Doax & Co.....	45		
22. Sheldon & Graves.....	32 1/2		
23. Hamilton & Co.....	22 3/4		
24. Grissom & Co.....	20		
25. Sparrow & Co.....	20		
26. Hamilton & Co.....	20		
27. Mrs. Plato.....	10		
28. L. S. Bowers.....	20		
29. Winters & Booth.....	20		
30. John D. Winters.....	30		
31. Coover & Co.....	21		
32. Sice Company.....	13 1/2		
33. Imperial S. M. Co.....	65 3/4		
34. Winters & Co.....	50		
35. Dall & Davis.....	25		
36. Johnson & Ladman.....	25		
37. Rogers & Whipple.....	25		

.....3,836,000

28. Arington & Co.....	25		
39. Irvin & Co.....	30		
40. Burke & Hamilton.....	40		
41. Stewart & Co.....	30		
42. Yellow Jacket.....	1,200	1,000	1,200,000
	11,213		23,470,000

The above Companies from No. 1 to No. 21, are incorporated, with the exception of No. 16. From No. 22 to No. 42, the ground is all held in private hands with the exception of No. 34 which is associated with 21.

Numbers 16 to 43 inclusive comprises what is known as the Gold Hill portion of the Comstock Ledge. The total number of feet included in the above claims is 11,213, which, at present actual selling rates cannot be valued, in the aggregate, at less than \$24,000,000, or an average of a little over \$2,000 per foot. This estimate includes only those claims which are located directly upon the Comstock lead.

There are known to be numerous parallel leads in close proximity to the Comstock and more or less continuous, throughout almost its entire extent, all of which are more or less valuable, and in some of which the stock is held at from one or two hundred, to one thousand dollars per foot. To the north of the Ophir is Cedar Hill, which holds an immense store of metal, the value of which is daily becoming more and more apparent. Far up and all along the Eastern Slope of Mount Davidson, are leads, many of which are already assuming quite a prominence in the market. To the south of Gold Hill and the claims we have enumerated in that district, and down through Silver City, are still other numerous claims located within the sixteen miles square to which we are confining our remarks.

In all of these values we have taken no account of the city itself, with its numerous blocks of buildings and real estate, its immense stocks of merchandise, etc. We have moreover based our estimates at actual cost values in gold, where common labor is worth from \$1 to \$5 per day, and where money is worth from 2 to 4 per cent. per month, on good security.

As a further evidence of the richness of a portion of this ground, it is stated on good authority that the little strip of 468 feet between Nos. 20 and 35, has yielded not less than \$6,000,000, within the last three years—some portions of it having yielded \$3,500 per foot in a single month! Five feet changed hands in No. 26, within a year, at \$10,000 per foot. Some of the owners in this strip of 468 feet have made and spent a fortune in a month; others have pocketed and invested from \$10,000 to \$20,000 per month, clear of expenses. When people talked of \$4,000 and \$5,000 per foot in the early days of Washoe, they were set down as lunatics. Now the solid bars that are turned out every week, are pointed at, as indicative of the wisdom of the whilom visionaries, while the croakers of those days are now nearly crazy with vexation at their former faithlessness in the value of these mines!

Of the total number of 11,213 feet enumerated in the Comstock ledge, only about 4,000 have as yet been developed into dividend paying grounds; some two or three thousand feet more will probably be added to the dividend paying list inside of six months, and from 9,000 to 10,000 feet of this ground will be dividend paying within about one year from the present time; which developments will add very many millions to the value of the ground, and corresponding millions to the annual shipments from the district.

The developments in Reese River within the past six months, have fully equaled if not exceeded anything which was ever witnessed in Washoe, and there is good reason for believing that three years will do fully as much for that country as the same time has done for Washoe! The ball is in motion and now moves on by its own impetus. The probable result, figure it how we may from reliable data, is absolutely astounding.

Only a few months since, in common with most of our cotemporaries, we joined in deprecating the Report of the Secretary of the Interior in his estimates of the probable future yield of the mines of the Eastern Slope; but the results of the past few months have put altogether a new face upon the matter, and we are forced to acknowledge that the Hon. Secretary, is not so very bad at guessing, after all.

With all this prospective wealth, however, it should not be forgotten, that mining, even in the limited and immensely rich territory to which we have confined these remarks, is but a mere lottery, where the blanks far outnumber the pri-

zes. Taking the district as a whole, including outside claims hundreds will amass fortunes by judicious investments while thousands will lose by reckless ones.

**THE BOUNDARY QUESTION.**—The Boundary Commissioners now running the line between California and Nevada Territory have progressed so far with their work as to determine that Aurora City, lies about four miles to the eastward of the California line, while Honey Lake Valley, which had been pretty much given up to Nevada Territory, is found to be within the State of California. California will be a gainer in territory, but a loser in population by the adjustment; but a question of much vexation and inconvenience will be definitely settled.

**SILVER IN IDAHOE.**—Rumour says that silver bearing lodes have been discovered in Idaho Territory. A San Francisco company was incorporated in this city on Monday last to work one of these mines.

## THE MINING SHARE MARKET.

The Mining Share Market still continues quiet. The chief excitement of the week has been the defaults of certain speculators who have failed to come to time on some of their engagements. The market has been well tested, during the past week, some of its leading shares which were well sustained, though freely offered.

Ophir has been largely dealt in, 900 share having changed hands at from \$1,995 @ \$2,125, closing at \$2,000 firm. The dividends of this company will not be increased until after their new works are fully completed. A decided improvement in this stock may be looked for after that time.

Since the "cave" three or four hundred tons of ore have been taken out from an old pillar in the south part of the Mexican mine. This pays about \$200 per ton. During the past four years the ore taken out of this mine came from the southern portion of it, and at the time the accident occurred this portion had been pretty much worked out. As soon as their new shaft is completed they will drift to the northern portion of the mine and work exclusively in that. There is no stock of this mine in the market.

Gould & Curry has been but little dealt in during the week. A dividend of \$150 per foot was declared on Saturday, payable to-morrow. It is understood that the Directors might have declared \$175, still leaving a heavy balance for October, but the majority ruled otherwise. The total assessments from the start have been but \$150 per foot; the yield of the mine having furnished the balance of the heavy sum of fully \$700,000, which their mill and mining improvements have cost. The company has determined to still further increase the working capacity of the mill which they can now do without any interference with their usual dividend. The monthly yield of this mine alone, at the present time, is not far from \$400,000, while its monthly dividends are about 3 per cent. on its present market value of \$5,000 per foot.

Potosi Shares are much in favor, with but few offers. It is readily taken at \$1.150.

Savage is quiet at present. Chollar, ditto.

Best and Belcher are not much offered, and closed at \$825, although an assessment of \$100 per foot was levied on the 24th instant.

Hale & Norcross has not been enquired after. The mine works of this company will soon be equal to the best in the Territory.

Mexican No 2, which we suppose to be the same as that quoted "Spanish No 2" has met with considerable favor, and is quoted at a large advance.

This Company, we understand has struck very rich rock. Sales have been made the past week from \$37 @ \$60. It is confidently expected this stock will still further and materially advance.

## COPPER.

The copper trade is already beginning to assume considerable commercial importance. The shipments from the mines at the present time, are estimated at fully 1,000 tons per month, which will produce very nearly 200 tons of pure copper, worth about \$125,000. By the opening of another spring, this amount will probably be trebled. A large number of promising mines are now commencing to ship, whose ca-

facilities for raising ore will be increased several hundred fold within the coming six months.

The present rate of shipments does not fairly represent the quantity of ore being raised, however, from the fact that many mines are declining to sell at the prices now offering preferring to hold on to their ores until spring. Moreover a large portion of the ore now being raised, must remain at the mouth of the mines until some mode of concentrating the same has been adopted. The machinery now in process of erection by the Messrs. Pownings, at Copperopolis, will probably, soon begin to add largely to the production of shipments ore from that locality.

Buyers rates for copper ores, deliverable either in this city or at Antioch, are at present as follows, payments made in gold:—\$2 per one per cent. for ore yielding 8 to 12 per cent.; \$2 25, from 12 to 14 per cent.; \$2 50 for 16 per cent., and \$3 for 20 per cent. and upwards.

Copper mines do not appear to be suffering from the general depression so prevalent in other mining stocks. Although but little of this class of ore is offered at our Stock Boards, we are advised that there is considerable enquiry for this class of investment throughout the State, and much capital will soon be absorbed in this growing interest. The permanency of copper mines and their superior reliability, over other mining stocks, for investment, is beginning to be fully appreciated.

More copper discoveries are reported in the vicinity of Ione City, Amador county. These discoveries are supposed to be on the range of the famous Newton mine.

The Home Ledge, El Dorado county, has made its second shipment during the past week, 144 sacks. It comes to this city.

Several hundred tons of ore were received from the Napoleon by the Stockton boat on Monday last. A letter from one of the proprietors of the Oriental assures us that that company is now taking out ore in considerable quantity, and that their first shipment will soon be made.

Another extensive copper ledge has been discovered by prospectors from Marysville, in the vicinity of Brady's Ranch. The croppings are said to be rich and extensive. There is less excitement, now, concerning the Yuba copper lodes, but there is also more confidence and industry in developing them.

The Nevada Transcript of the 23d inst. says:—"Several companies, in the copper region in the lower part of the county, have struck fine leads. Among them are the General Hooker, Wild Irish and Copperhead. Several prominent copper men from San Francisco and Copperopolis have visited these mines within the past two weeks and pronounced them as rich as any in the State—Copperopolis not excepted. The owners of the above companies are pushing their shafts ahead and we shall soon expect to hear of heavy shipments of copper ore from this region."

The Mountain Messenger speaks very encouragingly with regard to the "copper fields" in the vicinity of Gibsonville, Sierra county. The Eagle Company is spoken of as having a ledge of concentrated mineral five or six inches thick at a depth of 50 feet. The Newark ledge "contains a bronze like deposit of native copper, disseminated through the rock in delicate sheets and fine particles. Ounce nuggets of pure copper have been repeatedly found in the hydraulic diggings crossed by this ledge." Native copper has been found in all the tunnels crossing the course of the Slate Creek ledge at Mt. Pleasant, but none of them have been run low enough to strike the solid ledge.

The Isabella lode, in Sierra county, is attracting considerable attention. The ore from this mine yields largely in silver. It is thought that the silver it contains will pay the entire expense of working the vein. Moderate sums are offered for shares, but no sellers are found. Work upon all the ledges in the neighborhood of Round Tent, Nevada county, and Empire Ranch, are being vigorously prosecuted. The Burra Burra and Rock Creek Consolidated Company have a well timbered shaft down fifty feet, with encouraging prospects.

The work of development on the Mount Diablo Copper Mines is still progressing, with improving prospects. The Mechanic's claim has a tunnel in 60 feet, most of the distance in hard rock; 17 feet more will strike the vein. The Keokuck have a tunnel in 65 feet. This company find three series of croppings on the surface. As the miners go down

the three are coming together. There are several other good claims in this vicinity. The Mount Zion is generally considered at the head of the list. The Great Republic has a mammoth 17 feet lead, which prospects well in silver as well as copper. The Rising Sun, the Hall, Uncle Sam, Eagle, Sam Moore, Copper Age, Ramelia and many other companies are located in this vicinity.

#### REPORT OF BIDS At the San Francisco Mining Stock Board, For the week ending Sep. 26, 1863.

Name of Companies.	Shares per ft.	Per Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.	Latest Asking Price.

## THE VALUE OF AN ASSAY—A CAUTION.

A gentleman last week was on the point of concluding a large sale of copper on the basis of a 10 per cent. yield—which was the estimate of a large house who proposed to buy. In time, however, to avert loss, he was induced to have an assay made.

The mean of three assays made to his order by Mr. J. H. Churchill of this city, amounted to 20.31 per cent. of metal. A buyer was found who accepted this estimate; the seller finding the cost of an assay a very small item in his savings.

The Humboldt Register publishes the following rather heavy item:

We see that a company has incorporated in San Francisco with an extravagant capital stock. It is the 'Humboldt Peak' G. & S. M. Co.—Capital stock \$3,960,000, in 3,960 shares of \$1000 each. Trustees, Robert Beck, L. B. Harris, L. Gers, J. M. Frey and G. W. Stewart. Don't know whether they reserved in trust deed the right to increase capital stock; but that already named ought almost to build a railroad to California.

The prevailing idea that lightning always strikes the tallest of a group of objects, was disproved at Woonsocket, Mass., when a cottage entirely surrounded by higher buildings and trees received the whole of a stroke.

An English Minié bullet and a Springfield rifle-ball met in the air during the siege of Vicksburg, were welded by the impact, and fell harmless to the ground. They are now firm friends, sticking each to the other closer than a brother or a lover.

## MINING LAWS AND FORMS

JUST PUBLISHED BY H. H. BANCROFT & CO., being a compilation of the Statutes of this State relating to Mining Corporations, Assessments, etc., with a digest of decisions of the Supreme Court and Forms for the Incorporation of Companies. Compiled by H. B. Congdon. 12 mo., flexible cloth, \$1.50. For sale at all the Bookstores. sept14

## New Patent Agency.

**WE HAVE CONNECTED WITH THE**  
Publication of the "MINING AND SCIENTIFIC PRESS"

**The Patent Agency Business,**  
And would invite Inventors and Discoverers on the Pacific  
coast, who wish Dispatch as well as Economy to call  
upon us. We have an Experienced Agent at Washing-  
ton, which, together with our own experience of several  
years, renders the  
**Mining and Scientific Press Agency**  
The most desirable place to make application for Letters  
Patent on the Pacific coast. Apply at  
Office of the "Mining and Scientific Press," Room  
No. 57, Government House, corner of Washington and  
Sansome streets, San Francisco. EWER & SMITH.

**FOREIGN PATENTS OBTAINED**  
By application at this office. Room 57, Government House,  
EWER & SMITH, Solicitors.

**NOTICE TO INVENTORS.**  
Inventors wishing to file Patents should apply at this  
Office, Room No. 57, Government House. Terms moder-  
ate. EWER & SMITH.

**PATENT RIGHTS.**  
Patent Rights Bought and Sold,  
At the office of the "Mining and Scientific Press" Agency  
EWER & SMITH.

**IMPORTANT TO INVENTORS.**  
Inventors who obtain their Patents through this Office  
can have their Inventions illustrated and described in  
the columns of this paper FREE of charge, they merely  
furnishing the engravings. We are also prepared to fur-  
nish engravings at reasonable rates. Those who do not  
care to go to the expense of having engravings prepared  
can have their inventions fully noticed and described in  
our columns, free of charge. The free use of our col-  
umns to aid them in introducing their inventions to the  
public will be found a most important advantage to in-  
ventors. EWER & SMITH.

**Offices To Let,**  
In the Government House, Corner of  
Washington and Sansome Streets. Two large suits of  
Offices, the most commodious and accessible in the city.  
C. A. CRANE, Proprietor

## GENERAL NOTICES.

**HAYNES & LAWTON,**

IMPORTERS AND DEALERS IN

GLASS WARE,  
FRENCH CHINA,  
Coal Oil Lamps, Table Cutlery  
CLOCKS,  
Silver Plated and Britannia Ware,  
ETC., ETC., ETC.**

**NO. 516 SANSOME STREET**

[CORNER OF MERCHANT.]  
SAN FRANCISCO.

**WHEELER'S  
Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the prin-  
ciples and witnessed the operation of these Pans, that  
they are decidedly superior for triturating and amalga-  
mating purposes to any other in use.

The most important principle connected with the op-  
eration of these Pans is the separation of the triturating  
process from that of extracting the amalgam from the  
sand. The chief cause of loss of the precious metals aris-  
es from the passing off of the same in combination with  
the quicksilver, during the process of triturating, and in  
cleaning up. By the introduction of the Separating Pan  
to follow the triturating this loss is entirely avoided. In  
working these machines there is no appreciable loss of  
quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated  
by the side of others on sands from the same vat, the  
Wheeler Pans have uniformly gained a large percentage  
of metals over its competitors, as well as a still larger  
percentage in the amount of work performed.

\* \* \* These Pans have been in daily operation at the  
Miner's Foundry, on First street in this city, where all  
interested are invited to call and examine for themselves.  
2016-1f ZENAS WHEELER.

**Wm. P. TAAFFEE,**

IMPORTER AND JOBBER OF

**Staple and Fancy Dry Goods,  
CARPETS, DUCK, ETC.,

FOUNDRIES & MACHINE SHOPS.

REYNOLDS'

Patent Cut-Off and Governor,  
FOR STEAM ENGINES.

137 of these Invaluable Machines,  
ARE NOW IN USE

In California and Nevada Territory, giving a perfectly  
regular motion and  
Saving 20 to 65 per cent of the Fuel.

Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to act  
and least liable to get out of order of any Governor in  
use. It can be seen in operation at the Golden State Iron  
Works, and at the Stone Breaker, foot of Market Street,  
San Francisco.

Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chimney  
or Valve in the Blast Pipe by the pressure of the  
steam in the boiler. It will regulate the pressure ten  
pounds on the square inch. It cannot get out of order  
and any person can put one up in an hour after the damper  
is put in.

Ingersoll's Patent Drill Press,

With which drilling can be done the same as with the  
common ratchet, and when small holes are wanted, it  
can be done four times as fast. The handle can be worked  
in any direction.

Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest  
market rates.

Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury  
to the iron. In use for the past EIGHT years.

Refer to—Sugar Refinery, San Francisco,  
Cottrell & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.

E. T. STEEN AGENT.

No. 33 Fremont Street, San Francisco.

MOYNIHAN & AITKEN,

Boiler Makers and Blacksmiths,

Mission, between Beal & Fremont Sts.,  
San Francisco.

N. B. All kinds of Boiler and Sheet Iron Work executed  
at the shortest notice, and on the most reasonable  
terms. Jy 29

PUMPS!

HARRISON'S

California Lift and Force Pump,

WITHOUT VALVES OR PACKING,

Suitable for Mines, Fire Engines, Wrecking or Irrigat-  
ing. This is the Cheapest, Lightest and most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

ALL SIZES;

Capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute—For sale by

C. H. HARRISON,

PHOENIX OIL WORKS,

1e-15 517 Front Street, San Francisco.

60 lbs. MARINE and

Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for Hulls and Decks of Vessels  
on ground. Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
Bottoms of Ships, it is equal to a coat of Stone, and  
is equal to Copper, no worms will over effect it, and  
cheaper than any other paint.

DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur,  
two parts Mineral Paint, mix with Coal Tar and apply  
hot.

For sale by all Ship Chandlers and Tradesmen, in boxes  
50 lbs. each, or by the Pacific Metallurgical Works.

25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal  
covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

DIRECTIONS:

HOUSE.—Mix three parts Mineral Paint with one part  
lute lead, thin with Linseed oil: if a lighter color is  
wanted, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white  
lead, mix with Linseed oil. Put it thick on a tin Roof  
one coat when properly applied will last three years.

San Francisco, July 14, 1863. Jy 20

A NEW PAPER MILL is to be erected by  
the side of the one already in operation on  
the San Lorenzo River, which is to furnish  
printing paper. The one now in operation  
manufactures wrapping paper only, and is  
said to be a very profitable investment.

The POWDER MILL, in the same locality,  
will soon be in operation. Most of the ma-  
chinery is already on the ground.

It is estimated, says the Pajaro Times of  
the 19th inst., that, within the last year, there  
has been invested, by Santa Cruz and San  
Francisco capitalists, in manufacturing en-  
terprises, on the San Lorenzo River, at least  
five hundred thousand dollars. These in-  
vestments are returning fortunes. It is said  
that John Sime, of San Francisco, has about  
one hundred thousand dollars in the Powder  
and Paper Mills.

THE OPPOSITION STEAMER, Moses Taylor,  
will sail promptly as per advertisement in  
another column. The announcement that  
she would be hauled off and placed tempo-  
rarily in the Mexican trade was without any  
foundation whatever.

The discovery of extensive lead mines in  
Missouri is now an established fact. In  
Franklin and Washington counties the de-  
posits are very rich, and working-men are al-  
ready earning twenty-five dollars per day in  
its extraction. Large bodies of the land can  
be bought for from five to ten dollars per  
acre, and it is estimated that one acre will  
yield four thousand dollars worth of lead.

Eye, Ear and Throat.

DR. DE CASTRO,

Oculist and Aurist,

WHO HAS PRACTISED IN NEW  
York and all the principal cities of Europe with  
such unrivalled success, and from each place is in pos-  
session of the most eloquent testimonials, many now con-  
sulted upon diseases of these delicate organs, with a view  
to their permanent cure. Deafness of long standing thor-  
oughly cured. The Doctor employs his (by the Medical  
Society of London approved)

Self-adjusting Artificial Tympanum,

For the relief of deafness, attended by loss or injury of  
the membrana tympani, and for the cure of discharge  
from the ear—the inventor—Dr. De Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of  
the paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state: the effect of the tympanum was instantaneous—  
quite like a miracle. Five members of the Medical Society  
from the corner of Kearney and Market Streets, New York, and the principal  
cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

39. Mr. Editor—Having been afflicted  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it is with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to re-  
commend Dr. De Castro's skill as an aurist.

JOHN REESE, Napa Valley.

James Callaghan, witness.

San Francisco, July 30th, 1863.

[From the Daily Alta.]

San Francisco, June 30th., 1863.

ED'S DAILY ALTA:  
Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearney and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly; and is now, I am happy to state in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and I would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skillful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT,

812 Green Street.

## MINING NOTICES.

**Wide West Copper Mining Company, Office 528 Montgomery Street, San Francisco, September 10, 1863.**—Notice is hereby given that an assessment of Twenty-five cents was this day levied on each and every share of the capital stock of the Wide West Copper Mining Company, and payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, or to J. M. Pike, Superintendent, at Copperopolis.

## MINING &amp; SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND

SCIENTIFIC PAPER ON THIS

CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES.

A new volume of this extensively circulated paper

commenced Sept. 11, 1862. It is intended that every

number shall be replete with information, concerning

Mining, Scientific, Mechanical and Industrial pursuits,

together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purpose, together

with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper published.

The Mining Interest!

Will find it of great value, as it will contain all the

news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to the

purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of

bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and

also of receiving any information that may be necessary in obtaining his patent, the proprietors having his great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with

large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects and Millwrights

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers:—Four Dollars per annum

## Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Names can be sent in at different times and for different Post-offices. Specimen copies will be sent gratis to any part of the country.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, OCTOBER 5, 1863 NO. 49.

## REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

## TEMPERING STEEL.

The state of combinations between iron and carbon, which appears to be essential to form steel of the best quality, is, as is well known, destroyed by heat, so far as to entirely impair its most important qualities. In tempering steel, the effect produced by plunging the heated metal into cold water, is a sudden contraction of its bulk. The particles of steel are suddenly driven together, as if by concussion, presenting a very close analogy to the effect produced by hammering. It is the character of this concussion that determines the combinations of iron and carbon which results in the formation of steel. The heating of the metal not only expands it, but also gives to its particles a certain mobility, which enables them so to manage themselves, that by the sudden concussion which takes place in cooling, the peculiar combination necessary to the formation of steel is affected.

If a bar of iron is heated to a bright red heat, and hammered on an anvil, covered with finely-powdered charcoal, until it has cooled down to a dull red heat, and then plunged into cold water, it will be converted into steel at the surface. A bar of iron heated to a bright red and cooled to a dull red in powdered charcoal, without being hammered, will not present any signs of steel, when plunged into cold water like the bar previously hammered.

Take untempered steel and dissolve it in acid and there remains a black substance, resembling graphite, which is insoluble. When tempered steel is thus dissolved the insoluble residue is not more than one eighth that of the untempered. It appears, therefore, that tempering produces a true chemical change in steel. Steel formed by hammering, leaves a much larger percentage of insoluble residue than that formed by tempering in the usual way.

Hence it is inferred that the combination produced by hammering is not so complete as that produced by tempering, because it produces a concussion of the particles of steel in one direction only—in the direction of the blow—while the sudden cooling by water causes a concussion of the particles in every direction at the same instant.

In tempering, the more sudden the cooling, the greater is the force by which the particles are driven together, and the hardness and other characteristics communicated to steel in tempering, are in an increased proportion to the time of cooling.

[From our Special Correspondent.]

EDITOR OF THE MINING AND SCIENTIFIC PRESS:—It will be unnecessary, I suppose, to give an account of my trip to Stockton per steamer, for beyond the clear, soft blue sky, brilliant moon, and balmy nights of California's summer season, it possessed no unusual interest. It would be improper, however, to omit an acknowledgement of the usual courtesies, which the Steam Co. extend to the Press upon these occasions, and we beg to return our thanks for the attentions so liberally bestowed upon us.

## THE FAIR.

The first day of the Fair, never amounts to much anywhere, being chiefly confined to a suitable arrangement of articles for exhibition in the pavilion, and to racing. With reference to the latter, the people of this district may be satisfied; for, I understand the horses, running and trotting, made better time, than any previous year. Dr. Holden, with cordial politeness, presented myself and friend Bromall, with complimentary tickets, bidding us use them well and freely, wherever we desired to go, and for whatever we wished to see. The stock exhibition, the races, and military reviews, I could not visit, being prevented by attention to my special mission. They were all admirable, however, and passed off brilliantly, with one exception, when by the use of an old gun, totally unfit for service, a soldier had his arm blown away, a little below the elbow. His recovery is doubtful.

## THE MINING DEPARTMENT.

In conformity with my instructions, I paid particular attention to the "Mining and Mechanical Departments;" but dotted down some general observations, of such articles of local produce and manufacture, as I thought possessed sufficient importance to be generally interesting. In neither of the first cases was the exhibition large, although good. Fine samples of ore were on exhibition from various mining localities. Two large blocks of Copper ore were especially noticeable, from the Napoleon and Keystone leads; but as I shall have to speak of these wonderful mines when I get to Copperopolis. I shall say no more at present, than that their samples for size and quality were magnificent. There were splendid samples from distant mines, Washoe, Reese River, and New Mexico, of silver and copper, which I pass over, as not coming legitimately under observation. The Great Republic and Hall claims, Monte Diablo, had good specimens present, calculated to raise the copper interest of that section. Lalla Kedolka, or some such name, Toulumne county, had good samples. The Colton claim, Hawkeye district, Calaveras county, very good. Gopher district, same county, the same. Copper Hill Company and Lone Star, both copper, located at Campo Seco, had very superior samples. The Antelope Company, Calaveras county, silver, had a splendid piece of rock. The Dead Set, Col. Warren, Beach How and Confidence leads, were simply marked Mariposa; their sample were good in general. The Circle of Light claim, exhibited croppings of silver ores from Plata Verdi, the best I have seen in the State; while the Chancellor Pettigrew, the only gold specimen I saw on the table, Sonora, Toulumne county, bordered upon the magnificent. There were other ones of greater and less value exhibited, from different coun-

ties, which I have no time nor space to notice; and in concluding this portion of my letter, I would observe, that many of the labels were incomprehensible, a fault very much to be regretted as it causes unnecessary confusion and trouble. Those exhibiting articles of value and general use, should be more explicit in their descriptions.

## THE MECHANICAL DEPARTMENT.

As I have already stated, the Mechanical Department was not large, but the articles were superior, I shall notice only a few of the most prominent. The first was a large and magnificent hearse, by Hoffman and Brendt of this city, made to order for the coroner and valued at \$1,600. It is really a gorgeous piece of manufacture; but whether it will benefit those whom it carries to their last home, I know not. There is nothing of the kind equal to it, however, in the State. In these days when we pay so much attention to the dead, and so little to the sufferings of the living, I suppose it is all right.

Mr. J. Pierce of Stockton, had a magnificent set of drawing-room furniture, that would do credit to the Occidental. Nash & Fogg had a case of gentlemen's boots, worthy the dandies of Paris, London and New York. Webster Bros. had a most ingenious corn-sheller, which will be of great use to this State. The machine I thought most of, for its convenient size and great power, was the Union Plantation Mill, for grinding corn, on Baker and Hamilton's stand, but manufactured in Philadelphia. It makes excellent flour, and needs only the labor of one man; they had also an air-churn which makes butter in three minutes—only think of that. Mr. Miller, of this city, offered two splendid wagons, for single and double spans, which for lightness and strength, were much admired. There were any amount of washing machines, which appeared to attract the ladies; but on listening, I found their opinions varied so much that I prudently abstain saying anything about the particular merits of either. Dr. Debrom of this city, had a most beautiful glass machine, showing the circulation of the blood through the system. It is beautiful, meritorious and instructive.

I am sorry I have not time to notice the many other useful exhibitions present; but I cannot omit saying, that if Stockton does not go much ahead in buildings and improvements, her citizens are alive to their interest, and present articles of home manufacture, which would do credit to any State in the Union. J. D. P. Walker, had two sets of harness: one buggy and one wagon, which in material and workmanship would vie with the celebrated Consend harness.

The other cities of prominence were all represented.—Bowen & Co., of San Francisco, had a magnificent assortment of family groceries of every description. The Messrs. Taylor of Sacramento street, sent up some of their own paper, which is spoken of in the highest terms. A Mr. Jno. Burns, had some horse-shoes, and racing plates which for finish and designs, I never saw surpassed in England. Jacobin, of the Pioneer Distillery, Marysville, had a jar of turpentine, and glass resin, made in their establishment, which all agree, cannot be beaten by any country. Provost of San Jose, had a magnificent display of silk-worms, which were very interesting as they were busy at work spinning. I have long advocated

the cultivation of the mulberry tree, instead of the grape-vine, for a product of value, and a means of industry there is no comparison between the two, so far as the best interest of the State is concerned. There was any amount of California wines exhibited, but I don't think much of that branch of our revenue.

#### FRUIT EXHIBITION.

Although this section of country has been slow in cultivating good fruit, they have succeeded at last. A more magnificent display was never presented to public inspection. Mr. Benson, from Mokelumne river, had ten apples which I measured, and found they averaged 15 inches round. I took the length of a bunch of six carrots, and found them all nearly three feet long. The Mormon Slough Garden, gave grapes weighing five pounds and upwards per bunch, while the berry was as large as those of France. There was one bunch, from a Frenchman, more splendid than any I ever saw in France. Squash, beets, cabbages, etc.—were ever such monsters seen? One pear, out of hundreds, of the Dutchess D'Angeloine tribe, weighing 33 ounces—didn't ones teeth feel funny. There was a bag of sweet Lisbon onions, grown by Mr. Murray, which he says are infinitely better than any he ever grew in the richest soil of Ireland. They were really magnificent. Mrs. Dr. Beatman had a sample of home-made raisins, one year old, and others of dried apples, pears, peaches, plums, not to be surpassed in any respect. You must understand, that I have only culled these particular specimens from a host of the highest order, and which I do not mention, simply because I have not time. I can only add, in this connection, that San Joaquin is entering on a bright destiny.

#### FANCY ARTICLES.

The ladies' handi-craft formed a conspicuous feature this year. I could not spend the time I desired in examining its many treasures of tastes and skill. Mrs. So-and-so and Miss Something-else, had so many articles of costly beauty and magnificence, that I concluded it would be too dangerous to mention any particularly. I cannot omit, however, even at the risk of having my head taken off, mentioning a blue dress-coat, with gold embroidery by Mrs. Melender. It certainly, for gorgeousness and accuracy, beats all of the kind I ever saw; not accepting the official coat of His Royal Highness, the late Duke of Sussex, while at the head of the Masonic order in England; for, though not so varied in color, it was equally grand and elaborate in execution. Babies' caps, dresses, bed-covers, and a thousand things, mysterious to us bachelors, laid in profusion before me, and all I think it safe to add, on this branch of industrial skill and energy, is: God bless the little fingers making them; may they never weary in their own duties of life, for it is far better to be thus employed, than manufacturing bloomers and writing politics.

I acknowledge this is but an imperfect description, but copious enough, I trust, to be satisfactory to my old friends in Stockton, who have treated me so kindly on my re-appearance amongst them, and interesting to your numerous readers, whose indulgence I crave on this occasion. The post is closing, and I have to prepare for the ball to-night. The lady I take polkas easily at 2-30, which is fast time, and the thermometer stands somewhere about 90—if I survive you shall hear from me next week. L. HARNETT.

**OIL WELLS.**—A correspondent writing from Titusville, Pa., furnishes the following in reference to the oil regions in that State: Almost as old as the hills surrounding it are the springs which once gave it the name of Oil Creek, and now makes its fame world-wide. There is but one king here, and all are subjects. The head and front, the root and branch, of every species of business, in its legitimate callings—as speculation in its most rampant form—is oil; consequently you see, in close proximity on every side, oil depots, oil refineries, oil derricks, oil tanks, oil shippers, and the everlasting inevitable oil team—at once a nuisance and a necessity, as you may judge when two thousand of them have passed over a given point or bridge, where a market was kept, in one afternoon, cutting up the roads in a frightful manner, and reducing them to such a state that, between mudholes, stones and stumps, you may well suppose that pleasure riders are not the order of the day. For bustling activity and teeming population we resemble Western towns; while dreams of wealth, wilder and more fabulous than the Arabian Nights have been realized in a day. What do you think of "the big well," which flows two thousand barrels a day, bringing its owners an income of two dollars a minute, and supplying

one-third of all the oil sold here. There has been a million of dollars paid by its owners for this well—one small share having been sold for \$15,000. These are only a few facts of the many, of the wealth accruing privately and collectively to individuals. The well owned by Dalvell Brothers, brings them eight hundred dollars per day. The revenue which accrues to the Government, is five millions a year. What has the South to offer equal in resource to our oil wells?

EL PASO CITY, LOS ANGELES CO., }  
Aug. 27, 1863. }

**ED. PRESS:**—It is a very dull time with us; hot weather; but little emigration. I suppose all are waiting to cast their votes before starting out.

I have been at Ophir City for some days past helping the Tappan Company to open their tunnel to the Ohio lead. They are progressing finely. While absent a circumstance of considerable interest has transpired: No less than the advent of a live white woman, the first ever seen in this district, who has accompanied her husband, Mr. Boyd, with a loaded ox team, to Slate Range, on a pleasure trip, I suppose. They passed through our city yesterday, and will probably return in about ten days.

**31st. AT OPHIR CITY.** For three days we have had terrific thunder and lightning storms, accompanied with rains, lasting about an hour or more, breaking through our tents in all directions, and washing everything inside, upon the ground, making our situation very uncomfortable. The sun, however, comes out warm a part of the day, so we shall soon be all right again.

Messrs. Milliken & Warner have just completed a good board house, (the first in Ophir City,) and outsiders have had the privilege of sleeping there while their camp floors were drying.

**SER. 2.** A team just arrived from Los Angeles, with supplies for all hands, and news up to the 25th ult.

I heard that Geo. Merrick, the young man who was wounded by his own pistol, while riding on horseback, has had his leg amputated; was very low, not expected to live. Charles Nesbitt, who was so severely wounded in a tunnel here, Aug. 14, was doing well and able to be out.

**7TH.** The team started back to-day and took 14 more specimens of ore croppings for your cabinet, and some for assay.

But little prospecting is done here now, yet as many as six new and promising leads have been located within ten days.

The work of tunneling is going on without interruption, and in a few weeks we hope to be able to send up some rich ore for reduction.

The Live Oak Gold and Silver Mining Company have just got their deed of trust signed, preparatory to incorporating. And intend going to work on their claims, La Platas 1, 2 and 3, and the America, right away.

The Gila, (pronounced hee-lah,) River excitement has had a tendency to direct the tide of emigration from us to a great extent, and may seriously retard our growth. We hope that the hard working men will come here, as this is far enough from civilization, though only half as far as the new diggings.

**9TH.** In Press, No 39, we notice a reference to a new drilling machine, invented by Mr. J. S. French of Bangor, Maine, and I earnestly wish that something of the kind could be introduced here, where tunneling is the main business of all.

Could you not influence some clever man who has a first-rate article in that line, to send us out one as a sample, by which we can order more if they are successful. I would take all the responsibility required in the arrangement, and our mines would throw some of their feet in the market, at a very low figure, to procure a machine, which would take the place of handwork. C. W. T.

**HOW TO ADMINISTER CASTOR OIL TO CHILDREN.**—The Medical fraternity of Paris recommend the following way of administering castor oil to children:

The quantity of oil prescribed is poured into a small earthen pan, over a moderate fire, an egg broken into it and stirred up so as to form something like what cooks call buttered eggs; when it is done, a little salt or sugar, or a few drops of orange water, or some currant jelly should be added. The sick child will eat it eagerly and never discover the fraud.

A single firm pays one hundred and fifty thousand dollars a year to the London *Limes* for advertising.

#### MATERIAL FOR WINE CASKS.

A correspondent of the *Alta*, furnishes, in substance, the following to that paper:—A question of no little importance to the wine-growers of this State is that of casks to hold the wine. Hitherto pipes used in importing liquors have been employed, but experience has proved them in many ways unsuitable, to say nothing of the fact that the supply will soon become totally insufficient for the demands.

The ordinary material for wine-casks is oak, but the oak of California is too brittle for any such purpose, and new casks, made here of imported oak, cost about 20 cents per gallon. The winegrowers of the State were in a serious difficulty; they thought of sending to Manchuria for stave timber. Fortunately they are now under no necessity of going so far. It has been discovered that the redwood of California will serve the purpose; and for this important discovery the winegrowers are indebted to Col. Harazthy. The redwood is a tree peculiar to the coast of this State;—it is not found in any other part of the world. The tree is, next to the mammoth tree, the largest species of the vegetable kingdom, growing to be 300 feet high and 20 feet in diameter. The wood is straight in grain, and it splits very finely; and it is thus peculiarly fitted for stave timber. But the wine growers were afraid of it because it has a strong red color, and a very astringent juice, as is shown by the black color which it assumes whenever iron touches it in a moist place. Both the color and flavor of wine therefore were in danger from it. Col. Harazthy tried to draw out all soluble color and flavor by steaming, and he succeeded; and the wood was thus rendered fit for wine casks. He steams the staves for sixteen hours. He says that he has proved the fitness of redwood thus prepared by a trial of four years.

**IMPORTANT ALLEGED MEDICAL DISCOVERY.**—Among the latest reports of the principal hospital of Paris, is an account of a discovery of great importance. It appears that a young student enunciated the theory that gangrene or mortification was caused by a deficiency of oxygen in the part affected, and advanced so many plausible reasons in support of his views, that the surgeon in chief to the institution, who happened at the time to have a case of gangrene under his care, determined to give the hypothesis a fair trial. The patient was over seventy years of age, and his foot, in which the disease was making rapid progress, was about to be amputated. The mortified part was enclosed in an apparatus so contrived as to yield a continuous supply of oxygen, and the result was that the gangrene was arrested and the foot saved. The experiment was repeated in the case of another patient equally aged, and with the same success. The inference is that oxygen thus applied, is the specific for a disease which is the scourge of all hospitals for the treatment of surgical cases. Since the present war commenced, probably many hundreds of our soldiers have died of gangrened wounds, and if the application of so simple and agent as oxygen gas will stop the progress of decomposition in living flesh, by all means let the French mode of treatment be adopted in all our military hospitals.

**ANCIENT SYSTEM OF TELEGRAPHING.**—At the Royal Institute, Professor Thomson lately drew attention to an ingenious system of signalling invented by Aeneas Tacticus, 300 B. C., and described by Polybius. Two earthen vessels of the same form and size were filled with water, and provided with a stopcock. One was kept at head-quarters, and a scout carried with him the other. Down the sides of each were placed short sentences, such as "enemy moving off," "enemy coming," "enemy gone," &c. The scout, when he found out what he wanted, keeping himself all the while in sight of head-quarters of his own general, was to wave a flag or a light torch, and simultaneously allow the tap of the vessel with him to be turned to allow the water to run out. The tap of the vessel at head-quarters was also to be turned on. When the water had sunk to the sentence he wished to communicate, the scout would wave his flag or light his torch the second time, and by immediately turning the tap of the vessel in camp, the general would see where the level of the water then was, and correspondingly the sentence affixed, by which contrivance he would receive information some hours before the scout could personally communicate it.

**AN AMERICAN TEA.**—We have heretofore alluded to a shrub which has recently been brought into notice in Pennsylvania as a substitute for tea, of China growth. We find the following additional paragraph in relation to this article:—

An excellent substitute for tea grows in large quantities in Tioga county, Pennsylvania. It is said to resemble Chinese tea so much that merchants buy it to mix with the genuine. In Clinton county, Pennsylvania, the genuine article is claimed to grow in abundance, and the citizens thereabout are jubilant at the prospect of becoming independent of the "pig-tails." One gentleman, who owns a farm on which the herb is indigenous, says that his attention was first called to it by a native Chinese, who declared it to be the genuine China tea-plant. The gentleman uses it on his table, and no one suspects it as not being the imported article.

# ASSAYS!

Promptness and Accuracy Secured  
By the Use of the Most Improved  
Methods of  
ANALYSIS!

Advantageous Terms for Prospector's Clubs  
and Mining Companies.

**New Style of Ladies' Buckle!**

**W. BOHM,**

INVENTOR AND PATENTEE.

THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the  
Construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
possesses several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
It sells all other buckles in

Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine  
the Buckle at the Jewelry Establishment of

DRAYMAN & LEVY,

621 Washington Street, San Francisco.

JOSEPH H. BROTHERS,

607 Montgomery Street, San Francisco.

FLOBERG & CONRAD,

118 I Street, Sacramento.

Agents for the Patentee.

Every Buckle sold, stamped "W. Bohm," will be  
guaranteed as to its Strength and Durability.  
Jy6

**APARTMENTS.**

FINISHED APARTMENTS, WITH OR WITHOUT  
Board, at 1018 Powell Street, between Clay and  
Washington Street. Persons desirous of a respectable  
home will do well to apply. Jy6

# THE

# BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any place of mining machinery.

BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1850, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds, and  
the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.

TAY, BROOKS & BACKUS.

HOME MANUFACTURES.—Mr. J. L. Gibson,  
of Forbestown who some time since com-  
menced the manufacture of resin, etc. in that  
vicinity, has recently shipped to Hucks &  
Lambert, of this city, 14,000 lbs of resin,  
manufactured by him. His still has been run-  
ning about six weeks, and he has made about  
one thousand gallons of turpentine. He also  
manufactures champhene. In the last 26  
days, says the Marysville Appeal, from which  
paper we gather these facts, he has distilled  
1,150 gallons of spirits of turpentine and made  
168 barrels of resin, of 280 pounds to the  
barrel. His still is of 800 gallons capacity,  
and with his present arrangements he can run  
300 gallons of crude turpentine per day, mak-  
ing daily about 50 gallons spirits turpentine,  
and 2,000 pounds resin.

**G. E. MOORE,**

Assayer and Analytical Chemist,

No. 612 Sacramento Street,

HAVING ESTABLISHED a CHEMICAL LABORATORY,  
furnished with every requisite for delicate Analyti-  
cal work, is prepared to execute the Assay and Analysis  
of Ores, Mineral Waters, Guanos, etc., with accuracy  
and dispatch.

**TO QUARTZ MINERS.**

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centro and passes under it, between the grinding sur-  
faces, to the circumference: from whence it passes again  
over the muller to the centre, through the holes and be-  
tween the grinding surface to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the makers thereof. My Amalgama-  
tors can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.  
sep21 THOMAS VARNEY.

## VENTILATION OF MINING TUNNELS.

A most important feature of the expense of running tunnels of any great length, in this country has heretofore been absorbed in the supposed necessity for sinking air shafts, every few hundred feet. We have frequently alluded to the bad management, or rather, lack of knowledge of the principles of ventilation in underground operations, both in driving tunnels and in drifting per endicular openings, or shafts. A late number of the Virginia City Union gives the following very good plan recently adopted at the famous Latrobe tunnel, in Virginia City:

When this tunnel had reached a length of only a few hundred feet, it was found necessary to sink an air shaft, and at F street another; at this point the bottom of the shaft was closed up with the exception of a hole about ten inches square, through which passed a wooden box flume of that size, by which the air is conducted into the futher extremity of the tunnel. The draught is so strong, that notwithstanding the tunnel is west of A street, no other shaft has yet become necessary, and it is thought that no more will be required, as it will be but a short time before it connects with the works on the Comstock. A candle held at the mouth of the flume will be instantly extinguished. Throughout the whole of the great distance which this flume supplies with air, the tunnel is cool and pleasant, and a person can breathe with almost as much ease as in the open air. This plan of ventilation was first suggested to the superintendent of this tunnel, we understand, in reading the translation of an old German work on mining.

The Latrobe tunnel is now in about 2,600 feet, and is in daily expectation of reaching the ledge, (Com. tock,) which it will strike at a depth of 465 feet from the surface.

The Santa Fe mine, also in the Virginia City district, is ventilated on a similar principle. A tin tube, some four inches in diameter, is connected with a tall wooden flue standing in and reaching to the surface of an air-shaft, and running back from the bottom of the shaft to the furthest end of the tunnel, where the drifters are employed.

**MEXICAN MINES NEAR GUYNAS.**—A correspondent of the *Bulltin*, writes as follows from Guynas under date of May 20th:

As to mines, the machinery of Los Bronces is nearly up, and will be all in order by August. Guasapares, Judge Hard's place, is now about running. Judge Bott's Alamos will be running in a fortnight. La Prieta—engine up, and will run within three months. San Marcial Silver Mining Company is well on. Cruccitas will probably be in operation in September. In *bonanza* are the following: Bronces, Cabbi, Cotera, Lambona, Cruccitas, Fresnel and some others. The mines of Cercochui (Sangre de Cristo) and the Dios Padre, so persistently alleged to be in *bonanza* [prosperity] by that veracious sheet, the *Alta*—I dare not say of course, for private and weighty reasons—I again assert to be *still in dead work*, without true ores; and I challenge any proof to the contrary.—*Bulltin*.

In Chihuahua, the mine of Le Crun, Pastrana, and those of Robinson, San Pedro—both in Batopilas—are in *bonanza*. Col. Allen's mine in Urique is a second Ophir; the amount of silver extracted daily is only limited by the capacity of the hacienda. The ores are very rich.

**A NEW COD FISHERY.**—It has been known to whalers for some years past that good cod fishing grounds existed on the Pacific coast, some fifteen days sailing from the Russian port of Petropaulovski. The first fruits of these fisheries, so far as we have any knowledge, arrived at this port, a short time since in the brig Timondra, which brought in some 15 tons of the genuine article, equal in quality to the best ever caught on the Atlantic coast.

An extensive fishing ground of this description in the Pacific Ocean must soon become of vast importance not only in an economical point of view, but also as a nursery for seamen. It is chiefly from our fishing grounds that the Government, in its present emergency, has been enabled to obtain the great number of seamen needed to man our rapidly augmenting navy. We need just such a field in this quarter of the globe as a nursery for the future commerce that must grow up in the Pacific Ocean. It will be wisdom and economy for Government to protect and encourage it, by bounties, as heretofore at the East.

THERE are in the United States more men and estates that can be assessed for one million dollars each, than there were, at the close of Revolution, that could be assessed for ten thousand dollar each.

[For the Mining and Scientific Press.]

VIRGINIA CITY, N. T.,  
Oct. 2, 1863.

ED. PRESS.—I should have written last week, according to promise, but business prevented, and I am hardly in writing trim yet, as I wish to obtain undoubted information on every subject that appears in your columns from my pen.

The great excitement here now is Reese River, and to such an extent has the stampede that way increased, that all kinds of business here is almost at a stand still. This and the coming on of cold weather, have rendered Virginia dull for a time. We have fabulous reports of the richness of that country, but I have seen such excitements and heard such reports before, and am not easily led away by them. I believe that "Reese" is a very rich country, but I know that Washoe is; that its mines are now fully developed, that its resources are boundless, and I have no doubt that many of those who are leaving good businesses and comfortable homes for a place where all the known mines are located for miles; with the prospects of a severe winter, scarcity of provisions and lack of shelter, will return to the rich field of Washoe.

The standard mines here are pursuing the even tenor of their way, doing an amount of work and expending sums of money, that must be seen to be believed, while what are termed "outside mines" are working with wonderful energy. Rich indications are being discovered north and south of this place. In a short walk, last week, over the ridge below Gold Hill, where two or three years ago a man who would think of prospecting would have been thought visionary or crazy, I found some fifty deep shafts and tunnels, nearly all provided with heavy hoisting apparatus, worked by horse power, and on several claims large steam engines are being set up. The indications are as good as those in the best mines here, and when one or two of the "lodes" commence turning out rock for the mill, mark my words, there will be an excitement excelling any yet, and shares that now sell for \$5 and \$10 will count high in the hundreds; on the north, although not as fully developed, the prospects are as good; while on either side of this range the rich lodes are being energetically prospected.

So much for a general birds-eye view of Washoe as it appears to a returned Pioneer. In my next I will endeavor to particularize some of the most promising lodes, etc.

## QUILL.

## THE DISCOVERER OF ZINC.

Zinc was first discovered in 1530, by no less a personage than Theophrastus Aureolus Bombastus Paracelsus, the wild fantastic hero of Browning's celebrated dramatic poem. It will, perhaps, be new to most people to be informed that the very word "bombast" took its original meaning in the "great and swelling words of vanity" uttered by this singular genius. He it was who gave the deathblow to alchemy, and was first to show the utter hollowness of the then prevailing scholasticism, as respected physical investigations. Being appointed to the first professorship of chemistry, at Bale, in 1529—the earliest chair of chemistry ever established—he played such mad pranks, and kept up such a storm in poor little Bale, that the magistrate had to banish him from his chair. After undergoing many alterations of fortune, it irks us to say that poor Bombastus, to parody a modern phrase, "went to the zinc," and died miserably, in an obscure tavern in Salisbury, in the 48th year of his age.

JAPAN, just at the present time, is engrossing much of the world's attention. They are a people far superior to the Chinese in point of intelligence and will be likely to prove very stubborn in their disinclination to come up to the present ideas of civilization and progress, and open their ports, at the demand of the nations, to the commerce of the world. They are far less vulnerable than the Chinese, from the fact that all their important cities are in the interior. They have undoubtedly profited largely by the recent limited intercourse with foreign nations in supplying themselves with materials and skill in all matters pertaining to war. Destiny, however, is against them, and their proud Damios must bow to the fiat of civilization and progress. Our late naval visitor the Wyoming has most nobly opened the ball. Bye-and-bye we shall see what we shall see.

Everything is cheap in Japan. A first class house can be purchased for \$30. Servants work for 50 cents a month. For the use of a horse and groom one week, with food for horse and groom, \$1.50. A person can live comfortably in Japan for two cents a day, or fourteen cents a week.

**TIN-LINED LEAD-PIPES.**—It has been frequently proposed to line lead-pipes and cisterns with tin, in order to prevent the oxidation of the lead and the contamination of the water. This proposal has recently received an emphatic rebuke from the Liverpool Chemist's Association at one of their meetings, at which specimens of lead-pipe and sheet-lead electro-plated with tin, were exhibited, and some discussion ensued respecting the use of lead coated in this manner for water-cisterns and pipes. It appeared to be the opinion of the meeting that the coating of tin, instead of preserving the lead, was far more likely to ensure its more rapid corrosion, for, if the coating of tin by any means happened to be scratched off, even to the slightest extent, galvanic action would take place, and the lead would be destroyed very quickly. Mr. Nevins and Dr. Edwards stated that their experiments had proved that such would undoubtedly be the case; Dr. Edwards remarking, that in one case which he had examined a cistern made of lead, in which was an accidental admixture of tin, was eaten out by well-water in six months, the lead being rapidly precipitated in the form of sulphate.

**THE SHIPPING INTEREST.**—In our late exchanges some remarkable facts are given touching the maritime interest of the country. An Eastern paper states that during the first half of 1860, the number of vessels clearing from the port of New York in foreign trade was 1,795, of which 123 were American and 662 were foreign, showing a difference of nearly 100 per cent. in favor of American vessels. Comparing this statement with that of the present year, an astonishing change is apparent; the whole number of vessels clearing foreign ports was 2,167, of which only 747 were American and 1,450 were foreign. The interest of American owners are suffering in all parts of the world, and large transfers of tonnage have been made to foreign owners and protection of foreign flags.

San Francisco forms no exception to the general rule, there are to-day more foreign flags displayed by shipping in the harbor than at any previous time. Among the foreign shipping now here are vessels belonging to Prussia, Denmark, Hamburg, Bremen, Lubec, Russia, Great Britain, Sardinia, and Columbia. The high rate of insurance charged on account of the ravages of the rebel steamers *Alabama*, *Florida*, etc., has to a great extent driven American vessels out of our service for long foreign voyages, and the consequence vessels of other nations are doing the carrying trade.

NEW SHAWL STORE:—On Saturday evening Mr. J. D. Robert opened his New Shawl Store, No. 123 Montgomery street. We notice, until late in the evening an admiring crowd gazing at the beautiful patterns displayed in the window. No greater variety of patterns, richer in hue or finer in texture, can be found in London, Paris or New York, then are here displayed by Mr. Robert, from the richest Persian camel-hair down to the lower grade of American woolen. We wish him success in his enterprise.

Mr. H. B. Sontag, at the Mission, has one thousand thrifty-looking tea-plants of this year's growth, from seed procured by a Gentleman in China. As tea-plants must be four years old before the leaves are suitable for picking, some time must elapse before the success of the experiment of growing tea in California can be determined.

## ESMERALDA.

The mining share market in this district, the past week, has been quite active, a considerable amount of stock having changed hands at advanced figures. The Cortez consolidated and Clan Alpine having been sought after at a slight advance over quotations.

The Geraldine on Silver Hill, south of the Young Winnemuck is down to the depth of about 30 feet; the ledge is four feet wide, and prospects rich in silver, the rock is similar to the Yancy and Seymore on the same hill.

The Broadhead, on the top of Silver Hill, about 40 yard south of the Young Winnemuck, is a well defined ledge, and from present indications will yield as rich returns as any claim on that hill, the claim has been but little worked, but the rock is rich in both gold and silver.

The Walrath tunnel on the south-west side of Silver Hill below the Antelope is now in, a distance of 260 feet; the tunnel is five feet wide by 6 1/4 feet in height. The work is progressing day and night. This tunnel was located early this Spring and is being prosecuted with more energy than any one in this district. Therein, four ledges have been struck, one of which, (a blind ledge,) is even 12 feet wide, and assays \$134 per ton. The stock is mostly owed in San Francisco and none of it is offered in this market.

[The following letter, dated Sept. 24, 1863, from our regular Esmeralda correspondent, was intended for our last issue, but did not arrive until after we had gone to press.]

Since I last wrote you there has been no change, to quote, in the stock market of importance. Owing to a compromise about being made between the "Utah" and "Cortez Consolidated Mining Company," I learn that the Cortez stock is held firm at \$15 and but little offering.

Sixty shares Clan Alpine were offered to day for \$12, \$9 bid.

The Del Monte and Pond companies on Last Chance Hill are again working their claims with renewed energy. Since Monday last, the Del Monte Company have had 150 men at work taking out rock, which is being crushed at Messrs Starks, Fogus & Lake's mills; the four mills are running day and night on the Del Monte work.

**ARMING MAIL STEAMERS.**—It is announced to be the intention of the Pacific Mail Steamship Company to arm the new steamers which they are about to dispatch to this side. It is the intention to place on board of the ships, ten 20-pound Parrot guns.

**PATENT CLAIMS.**—We will furnish, on application, the claim of any invention that has been patented within the last fourteen years. The name of the patentee—date of patent, when known, and two dollars for copying should be sent.

**MODELS.**—Inventors will please attach to all models sent to us, their names and address, in a legible, permanent form, this will avoid confusion and prevent errors.

**DRAWINGS.**—We have highly talented and efficient Draughtsmen, by whom drawings of every description are executed in the best style of art, with promptitude, and at a moderate cost.

### WANTED

By a competent person, the Secretaryship of four Mining Companies. Books to be kept at the Office of the Mining and Scientific Press, No 57 Government House. Enquire as above. oct6

### AGENTS WANTED.

We want a good Agent in every city, town and settlement, on this Coast. Applicants will send their names with reference, when specimen numbers of the **Mining & Scientific Press** will be forwarded to them, and their names added to our published "List of Agents." EWER & SMITH.

### PARTNER WANTED.

The Proprietor of one of the oldest and most profitable country newspapers in the State is desirous of taking in a partner. He wants to dispose of one-half of his office to some gentleman well calculated to take charge of the editorial department, as he is a practical printer himself. For further particulars enquire at this office. oct4

### MINING LAWS AND FORMS

**JUST PUBLISHED BY H. H. BANCROFT & CO.,** being a compilation of the Statutes of this State relating to Mining Corporations, Assessments, etc., with a digest of decisions of the Supreme Court and Forms for the Incorporation of Companies. Compiled by H. B. Congdon. 12 mo., flexible cloth, \$1.50 For sale at all the Bookstores. sept14

### R. W. MYERS, & CO.,

Chases' New Mill, Fremont St., near Market,

ETC., ETC., ETC.

NO. 516 SANSOME STREET

[CORNER OF MERCHANT.]

SAN FRANCISCO.

### WHEELER'S

**Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\*.\* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 2016-1f

ZENAS WHEELER.

### Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

**Staple and Fancy Dry Goods,**

FOUNDRIES & MACHINE SHOPS.

**REYNOLDS'**  
**Patent Cut-Off and Governor,**  
**FOR STEAM ENGINES.**

127 of these Invaluable Machines,  
ARE NOW IN USE  
in California and Nevada Territory, giving a perfectly  
regular motion and  
Saving 20 to 65 per cent of the Fuel.

**Steen's Improved Governor**  
is the CHEAPEST, SIMPLEST and QUICKEST to act  
and least liable to get out of order of any Governor in  
use. It can be seen in operation at the Golden State Iron  
Works, and at the Stone Breaker, foot of Market Street,  
San Francisco.

**Clark's Steam and Fire Regulator,**  
for controlling the Draft or Blast by opening the Chimney  
or Valve in the Blast Pipe by the pressure of the  
steam in the boiler. It will regulate the pressure to  
pound, on the square inch. It cannot get out of order  
and any person can put one up in an hour after the damper  
is put in.

**Ingersoll's Patent Drill Press,**  
with which drilling can be done the same as with the  
common ratchet, and when small holes are wanted, it  
can be done four times as fast. The handle can be worked  
in any direction.

**Felt for Steam Boilers, Pipes, Etc.**  
at the lowest market rates.

**Steam Engines, Boilers, Pipes,**  
Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest  
market rates.

**Anti Incrustation Powder,**  
Sure Remedy for Scale in Steam Boilers, without inju-  
ry to the iron. In use for the past EIGHT years.  
Refer to—Sugar Refinery, San Francisco,  
Cottrell & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.  
**E. T. STEEN AGENT.**  
No. 33 Fremont Street, San Francisco.

**MOYNIHAN & AITKEN,**  
**Boiler Makers and Blacksmiths,**  
Mission, between Beal & Fremont Sts,  
San Francisco.

**N. B.** All kinds of Boiler and Sheet Iron Work ex-  
ecuted at the shortest notice, and on the most reasonable  
terms. Jy 29

**PUMPS!**  
**HARRISON'S**  
**California Lift and Force Pump,**  
WITHOUT VALVES OR PACKING,  
Suitable for Mines, Fire Engines, Wrecking or Irriga-  
tion. This is the Cheapest, Lightest and most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

**ALL SIZES;**  
Capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute—For sale by  
**C. H. HARRISON,**  
**PHOENIX OIL WORKS,**  
No. 15 517 Front Street, San Francisco.

**50 lbs. MARINE and**  
**Fire-Proof Paint,**

MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for the Hulls and Decks of Vessels  
on ground. Mineral Rock contains Arsenic, Copper, Li-  
thium and six other Minerals. When used on the Decks  
of Steamships, it is equal to a coat of Stone, and  
is equal to Copper, no worms will ever effect it, and  
cheaper than any other paint.

**DIRECTIONS:**  
For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Lined Oil.  
For Bottoms of Vessels, use one part ground sulphur,  
two parts Mineral Paint, mix with Coal Tar and apply  
hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes  
of 10 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**  
When used on Roofs, Buildings, or Fences, it is equal  
to covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

**DIRECTIONS:**  
MIXTURE—Mix three parts Mineral Paint with one part  
white lead, thin with Lined oil: If a lighter color is  
wanted, mix less paint, more lead.  
DOSE—Five parts of Mineral Paint, one part white  
lead, mix with Lined oil. Put it thick on a tin Roof  
the coat when properly applied will last three years.

**All Kinds of Edge Tools, Etc.,**  
Plane Irons Moulding Irons, Stone Cutter's Tools, etc  
No. 22 Fremont street, bet Market and Missio  
San Francisco, July 14, 1863.

**THE REBOUND.**—"Cosmos" of Virginia  
City, in speaking of the extraordinary rush for  
Reese River, says:

"Speaking of Reese River a gentleman  
who has just come in from there, says he  
passed 400 wagons in the distance of 70 miles,  
and as he had an eye to the fair, he says there  
were 72 women in the crowd, rushing onward.  
Verily the migratory wave which for so many  
years has been moving onward with the cry  
of "Westward, ho!" having met the waters  
of the Pacific, now rebounds in its eagerness  
for new lands, and Eastward it moves, to fill  
up that uninhabited space which lies between  
the Sierra Nevada and the western limits of  
the Western States.

**CAMEL TRAIN:**—A train of camels is run-  
ning from the Humboldt salt mines to Vir-  
ginia City, packing salt for the Humboldt salt  
company. This is found to be a cheap mode  
of transportation. Each camel is able to pack  
from 800 to 1,000 pounds. It costs nothing  
to keep them, as they will fat on sagebrush  
and greasewood, and the deserts which are so  
hard on horses and mules, are just what cam-  
els thrive on.

**MUNIFICENT BANKER.**—Peabody, the Amer-  
ican banker, in London, has signified a desire  
to give Yale College one hundred thousand  
dollars for a geological fund. Although Pea-  
body does not reside in his native country, he  
does not altogether neglect or forget it, as  
may be seen by his many acts of munificence  
to our public institutions.

**TREASURE FROM THE NORTH:**—The Steamers  
from the North are now bringing down large  
amounts of treasure every trip. The Brother  
Johnathan, which arrived on Monday, brought  
\$294,600. Of this amount \$259,600 is from  
Portland.

**Eye, Ear and Throat.**  
**DR. DE CASTRO,**  
**Oculist and Aurist,**

**WHO HAS PRACTISED IN NEW**  
York and all the principal cities of Europe with  
such unrivalled success, and from each place is in pos-  
session of the most eminent testimonials, may now be con-  
sulted upon diseases of these delicate organs, with a view  
to their permanent cure. Deafness of long standing thor-  
oughly cured. The Doctor employs his (by the Medical  
Society of London approved)

**Self-adjusting Artificial Tympanum,**  
For the relief of deafness, attended by loss or injury of  
the membrana tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M.D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of  
the paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state: the effect of the tympanum was instantane-  
ous—quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

**Dr. Editor—Having been afflicted**  
with deafness for the last two years, originating from  
a severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it was with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to re-  
commend Dr. De Castro's skill as an aurist.

**JOHN REESE, Napa Valley.**  
James Callaghan, witness.  
San Francisco, July 30th, 1863.

[From the Daily Alta.]  
San Francisco, June 30th., 1863.

**ED'S DAILY ALTA:**  
Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearney and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly: and is now, I am happy to testify in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and would recommend all parties similarly af-  
fected to give him a trial. My daughter has at different  
times been under the care of the most skillful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.  
**CHAS JOHN P. WRIGHT,**  
812 Green Street.

## MINING &amp; SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES

A new volume of this extensively circulated paper commenced Sept. 11, 1882. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to this purpose, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patent with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefitted by its personal, as its columns will from time to time contain original engravings of new machines and inventions, together with large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## To Chemists, Architects and Millwrights.

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers:—Four Dollars per annum

## Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

W. B. EWER, EDITOR. } A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC. } EWER & SMITH, PROPRIETORS.

VOL. VI. SAN FRANCISCO, MONDAY EVENING, OCTOBER 12, 1863. NO. 50.

**REMOVAL.**

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

**THE STATE FAIR.**

The State Fair, at Sacramento, although not all that could be desired, and much inferior to others which have preceded it, was nevertheless quite creditable to the State. Ill health prevented our being able to give it that personal attention which we should have been pleased to have done. The two or three hours we were able to remain in the Pavilion was devoted mainly to examining minerals and machinery, and of them only can we speak.

The display of minerals was quite extensive, but the total lack of classification and the unfavorable light in which most of them was displayed, rendered any extended or careful examination of them quite impossible. The number was very large, and many of them were very rich. There were about 200 entries, embracing several thousand specimens, including gold, silver, copper, lead, tin, cinnabar, coal, gypsum, soapstone, building stone, sulphur, salt, etc. The sight of this department alone, was well worth a visit to the Pavilion.

The district and region of Virginia City, although the headquarters of mining, was but poorly represented. We noticed specimens from only the Ophir, Mexican, Savage, El Cajet and Yellow Jacket.

Esmeralda was much better represented. She exhibited gold, silver, copper and tin. The tin ore from the Hawk Creek lode attracted considerable attention. Some twenty-five of the principal mines of this district were represented. Humboldt was represented by samples from fifty or sixty of her mines, among which we particularly noticed, one in charge of Mr. T. L. Wilson, several of which—as the Wilson, Ferguson, Wallace, Miami, Monitor and Ophir—were beautiful specimens of bromide, a very valuable and rare ore of silver. Mr. W. also exhibited fine specimens of chlorid of silver.

Reese River, was probably the most fully represented of any single district. The ores of this region were chiefly in charge of Mr. G. F. Semler, who had on exhibition, as we understand, specimens from 180 different claims, collected from a portion of country ninety miles north and sixty miles south of Austin. Among them were quite a number of specimens of chlorid of silver, which had been subjected to the action of heat, the effect of which is to condense the silver in little globules and flakes upon the surface of the rock. The exhibition of these specimens would have been much more useful and satisfactory, if the exhibitor had placed similar and mineral specimens by the side of those which had been subjected to the action of fire. The light, also, in which the

most of the Reese River specimens were placed was extremely unfavorable.

A large number of specimens of gold and silver were on exhibition from various parts of California, some very rich and beautiful, but we were unable to take the necessary notes to particularize them as they deserve, which we much regret.

The exhibition of copper ores formed a prominent portion in the mineralogical display. Ores were exhibited from Calaveras, Sacramento, Amador, El Dorado, Placer, Nevada, Shasta, Plumas and Del Norte counties. Some of the ores were very superior and in every variety in which this mineral occurs. We regret our inability to particularize.

No better opportunity is offered to our miners to bring to the attention of persons from various parts, the value and importance of their mines, than such an exhibition as that presented at the State Fair. People from all parts of the State assemble there at that time, to witness and compare the wonderful production of our skill, our soil and our mines. It is to be hoped that the experiment so auspiciously made to connect a mineral with the agricultural exhibition of our State, will be more fully and perfectly carried out another year. More attention should be paid to arranging and classifying specimens, and much valuable information might also be disseminated by a fuller system of labeling, so that persons unacquainted with the peculiarities of minerals might there be able to associate, to a greater or less extent, the name and character of minerals with their appearance. As it was, the exhibition could not be equalled by any other country on the globe.

**MACHINERY.**

The exhibition of Varney's Amalgamator, in practical operation attracted considerable attention—and many were enabled to see for the first time, the operation of amalgamating gold by machinery. We have fully described and illustrated this valuable invention in a former number of the Press. Mr. J. Cammann, also, exhibited a model of a new amalgamator for which letter patent have been applied through this office. This machine is quite novel in its construction, and works upon an entirely new principle from any hitherto made. We shall soon give a full illustrated description of this machine.

Mr. Elisha Hughes exhibited his patent Eyeless Screw Pick, which he is about introducing to the mining public. This pick has attained a combination of three important principles—strength, durability and convenience. It is quite novel in its construction. Mr. H. has made preparation for their manufacture on a large scale, in this city. When his works are fairly under way we shall give a full description of the instrument.

Mr. H. also exhibited a very useful and ingenious blasting apparatus, which he has recently patented. This apparatus will also be fully described in a subsequent number. It is something, which should be employed by every miner engaged in any kind of blasting.

Another invention which appeared to attract much interest, was a "tire-upsetter" invented and exhibited by Ira D. Card, of this city. It is the *ne plus ultra* of its kind and must soon come into general use. The patent for this machine was obtained through the Soliciting Agency connected

with this paper. An illustrated description of this machine will soon be furnished in our columns.

Several other useful and ingenious machines were exhibited, which we were unable to examine for reasons already stated. San Francisco was fully represented in the mechanical department of the exhibition.

**The Soledad Copper Mines—Los Angeles County.**

The rapid development of these mines and the great influx of labor, indicate a prosperity that is almost unparalleled and unsurpassed by any other copper mining region on the Pacific coast. They are situated about 30 miles from Los Angeles, in a direct line north-east. By the present circuitous road, through the San Francisco pass, the distance is computed at 60 miles. By making a road across the mountains, to the foot of which there is easy access from Los Angeles, some 30 miles would be lessened, saving of course one half the present expense of transportation, etc. The cost of constructing such road is estimated at \$20,000.

The town of the district is called Rasenna City, and lies in a cañon between the mountains, which run in a direction nearly north and south. The mines are situated on the western slope, the principal ones bearing north.

Copper was first discovered in this region some eight years ago, by a Frenchman named Maris, who, however, failed to follow up the advantage of his discovery; and it is only about eighteen months ago, that a mining camp was formed and the district fairly prospected. Since then, remarkable progress has been made.

The climate of this region is very salubrious. Wood is in abundance at a short distance, and easily obtained. The water is of excellent quality, and is amply sufficient in quantity for mining purposes the year round.

The ores generally, from this district, exhibit a remarkable degree of purity, being almost entirely free from admixture with baser metals; they consist chiefly of red and black oxides, accompanied in many cases by the gray and yellow sulphurets.

There has lately been discovered a quartz lead in this vicinity, which exhibits very richly in gold. Of this I shall write further as developments are made. Among the principal mines may be mentioned the Maris lead—this forms a portion of the property of the Soledad Copper Hill Co. A shaft has been sunk to the depth of 95 feet, and the ledge is now over seven feet in width. Grey sulphurets predominate with a large admixture of gold and silver.

The Jesus Maria lead also belongs to the above Company and is located in Soledad Hill. A lode of some four feet in width has been struck. The depth of shaft at present, is about 25 feet, with improving prospects. The prominent ores are gray sulphurets with a considerable portion of silver.

The Margarita, in the same district is being pushed forward with great vigor. The present depth of the shaft is 65 feet, and it is confidently expected that 35 feet more will give excellent pay rock; the ores from the mine are principally the purple or peacock species, merging into the gray and yellow sulphurets. This lead is undoubtedly one of the largest, richest and most reliable in the district.

I may reiterate that the general advantages of these mines in purity and yield of precious metals, are unsurpassed by any region on the Pacific Coast.  
C. W.  
LOS ANGELES, SEPT. 20, 1863.

(From our Traveling Correspondent.)

STOCKTON, OCTOBER 5, 1863.

MR. EDITOR:—In completing my report of the Stockton Fair, I must notice some articles on exhibition unintentionally omitted in my last letter, but which, as matters of public interest, I promised to mention.

On referring to my notes, I find I made a mistake concerning the huge block of copper ore from the Keystone claim, which I am desirous of correcting. This splendid sample, both as regards its size and quality, lay immediately under those of the Napoleon, when I took my notes; and, being then without a label, I necessarily concluded that it belonged to their specimens. I trust the Keystone will accept this *amende honorable*, as it truthfully explains the mistake.

In the horticultural department I omitted to speak of two magnificent samples of cotton, grown in this neighborhood; one on the tulares, the other on what is called the upland. The present condition of America has shown the immense importance of raising cotton in California, and these samples, I take it, settles the question. They are admitted by all acquainted with raising cotton to be equal to any produced by the oldest and best cotton States, both in quantity and quality. If any superiority should be claimed for either sample, it was that from the tulare ground, the cotton was more silky and fine. What a vast field is thus opened to California enterprise! Such portions of the tulares as are reclaimed, we know, produce the finest vegetables in the world, and now it is demonstrated that they will produce the best cotton. With this fact before us, surely the Government ought to redouble its efforts to reclaim these millions of idle acres; and make them, what they are capable of being made, the great cotton fields of the world. The sample from the tulares was raised by Mr. Paige, the other by Mr. Starkweather. The next article of home manufacture, comparing favorably with those imported, was a box of prunes admirably packed, by West & Brothers. They laid side by side with the best imported samples, and it was difficult, if not impossible to tell the difference. If any thing, the California samples were the larger and more pulpy. All they lacked was the rich glossy black of the foreign article and that every lady knows comes in time.

In speaking of different articles sent by the more prominent cities of the State, I omitted to do justice to the Pacific Glass Works of San Francisco. They had every variety of glass present of the highest order of merit. Their exhibition attracted much notice and praise. You will see by the published report, they and our friends, Messrs. Taylor & Co., paper manufacturers, each took special premiums. Knowing personally, the liberal and generous character of the latter firm, I took the liberty of speaking of them as they deserve, and I sincerely congratulate them upon the honorable notice their samples of paper received here.

With this, closes my account of the prominent articles on exhibition. I am happy to say the Stockton Fair has been entirely successful in every respect. The greatest justice and liberality were shown by the judges, and the fact of being a certain person, or coming from a certain place, was not the basis of their judgement of the merit of articles exhibited. The consequence is, their decisions have given universal satisfaction, because they are felt to be just. The entire receipts ranged somewhere about \$10,000, of which \$6,000 will go to the credit of the Society. At the same time, nothing could be more cordial or polite, than the attentions paid to members of the Press. To Dr. Holden my acknowledgments are especially due. In this gentleman, the Society have a faithful, efficient and attentive officer. During the week, he was the recipient of two silver goblets—one from the members and officers of the society, the other from the attaches of his own establishment. Well has he earned the distinction. Our paper is also under many obligations to Mr. Barratt, of the *Beacon*, for assistance rendered in various ways.

The excellent mining interests of this section are receiving proper attention, and large fortunes have been made by different parties. Mr. C. T. Meader, who now subscribes to the Mining and Scientific Press, as all ought who would make mining a successful business, is reputed to be worth over \$1,000,000—his interest in the Union ledge, the only one, perhaps, in the State having no shares for sale, being estimated alone at \$600,000. But of this branch of local wealth I shall speak more fully as I extend my travels. I must, however, here acknowledge the obligations I am under to

a brother of Mr. C. T. Meader, for many civilities in prosecuting my special mission.

The ladies declare I must not omit to say something about the Fair Ball. I beg to assure them I do not mean to do so, only I told them, I thought you would not publish what I said, as you were "not on the dance." I give you the chance of becoming popular forever; and getting all sorts of nice things should you visit these parts. Really, it was one of the most agreeable parties I have attended in the State. The San Francisco system of ladies dressing in bonnets and shawls is *tabooed* here, and a full dress costume is enforced. This is only just to those who go in full dress, as well as to those giving the ball. Taken altogether, the San Joaquin ladies are good-looking, and make a splendid appearance. I understand some gentleman, connected with the Press, intends publishing an account of each dress. That is far more than I dare venture upon. All I shall say is, after careful examination, that on this occasion, the dresses were all appropriate and becoming, generally beautiful, in some cases costly. Ladies I have redeemed my promise, and remain as ever your most obedient servant. Shall I say anything about the ice-creams and chickens?

In former years we used to hear so much about abuse in the management of the insane asylum that I determined to pay it a visit. Whatever it may have been in past years, it is not so now. It would be difficult to find anywhere, a better ordered, more cleanly, and well-arranged establishment. The bedding and food were particularly good. But what a mixture of pleasure and pain it creates to visit this establishment—pain at witnessing the sad condition of its inmates—pleasure at seeing the efforts made to give them all the material comforts they can enjoy. I confess it was with anything but pleasurable emotions I mingled with this crowd of madmen; but timidity soon gave way to astonishment at the idiosyncrasy of each case, and the real harmlessness of the men themselves. Here before you are some two hundred men all living in a world of their own, and that world bounded by a single idea, upon which their minds, in this insane condition, eternally dwell, knowing nothing, feeling nothing, seeing nothing but their own particular grievance. The inmates are men of all nations, but nationality is lost in the wreck of mind. The energetic American, the phlegmatic Dutchman, the methodical Englishman, the passionate Italian, the vivacious Frenchman, the savage Indian, are there before you, but the characteristics of the men are gone. Even in those cases, where they have become quiet and are grouped together in the yard, insanity is the most painfully oppressive sight I ever saw, or hope to see. There you have a large crowd of men in every conceivable and inconceivable attitude, some swinging, some lounging against the walls, some walking, some setting, some kneeling, some lying down. You see they are men, but that's all. With one or two exceptions not a word is spoken. The most deadly silence prevails. Every vestige of sociability is lost. They meet thus for months, perhaps for years, but every day meet and part as strangers, for each seems dead to the other, and all to live in their own sad world of one idea. Thus on walking about they never jostle or touch each other; on setting down, never crowd each other; on taking the swings, they wait until they are unoccupied; they ask nothing from each other, give nothing to each other; take no notice of each other, and as far as I could see, were men only in the capacity of moving, eating and sleeping. I had previously no idea that insanity destroyed so entirely the social nature of man; and yet, so intensely painful to behold, in other respects it is very fortunate. Were there communion of feeling or sentiment amongst the inmates of an asylum, there would necessarily be concert of action, in evil as well as good, and thus it would be impossible to govern them. Apart from the lessons of charity a man learns, the attentions from the officers he receives, and some minor material gratifications he enjoys, taken altogether, a visit to the asylum is by no means a pleasant thing.

And now, sir, I have done; but before I proceed on my journey, permit me once more, to thank the Stocktonians for their civility to me, and to bid them God-speed in all their undertakings.

LOW WATER.—The water in the mines and mining ditches throughout the State is unusually low at this time. The season is pronounced the driest one experienced since California became a State. The signs at present, however, indicate an early setting in of the Fall rains.

(From our Regular Correspondent.)

MOKEUMNE HILL, CALAVERAS COUNTY,  
OCTOBER 4, 1863.

MR. EDITOR:—Having promised to drop you a few lines for your valuable paper, I will commence by saying that our mines, the principal source of revenue of this county, continue to yield bountifully. This remark is not applicable alike to all the different localities, but to be taken in an average sense. Those localities in which the gold yield is dependent solely on the produce of surface ground, have seen, or will ultimately see, their sources refuse to yield the yellow stream; but those favored sections, where deep digging are found, have generally, an undisturbed and long future before them, and fortunately, there are many such in this county.

The untiring energy and perseverance of the miner, have as the surface claims become exhausted, developed and opened up, in our various mining districts, vast subterranean gold fields, which give remunerative employment to a vast number of workmen.

The most permanent among these discoveries is, probably, the region extending from Mokelumne Hill to the Calaveras River, along Chile Gluch, a distance of six miles. Some of the claims opened on this deep channel are among the best if not the very best in the State. The one owned by Paul, O'Neil & Co., I am informed, nets the snug little sum of one thousand dollars per month, to the share, and I believe the adjoining claims, of Lombard, Hit-or-miss and Calaveras, are nearly if not quite as good. All of the wash-dirt taken out of Paul, O'Neil & Co's and the Calaveras Tunnel Company's claims is crushed before washing, and passes from the battery into sluices, where the gold is collected. This is the only safe way to wash hard cemented, tough or clayey dirt, so as to concentrate all your gold in the sluices.

## QUARTZ MINES.

The Quartz Mining interests are duly represented in this county, but not to the same extent as in some other parts of the State. The regions about Angels, and West Point, are the places, where the most remunerative veins are worked at present. This branch of mining has not yet recovered from the shock it received in 1851 and 1852. Then everybody owned a quartz mine, and nobody knew how to work one, which is, in a great measure, the case now with copper mines. For this reason, quartz mining became unprofitable, and it has not received that share of attention, which its importance demands; and entitles it to; but it is, nevertheless, generally working its way into public favor.

While speaking of quartz, let me inform you that a company in your city has incorporated under the name of the "Leon Loto Gold and Silver Mining Company," for the purpose of working a well known quartz ledge, which is located about ten miles east of here, and which I believe, under proper management, will yield large returns to the company.

## WATER AND DITCHES.

As in prospecting and developing the mineral resources of our county, water becomes an indispensable and necessary element, let me inform you, and through you, the Mining public, that a great portion of our county is a complete network of flumes and mining ditches, and that water can be obtained at almost any place when needed for mining purposes, for about forty cents per inch. We have in the county 68 mining ditches, with a capacity of 10,000 inches, united length 583 miles, representing a cash value of \$500,000.

In my next I will speak of the copper interests of our county.

R. W. D.

CAPTURES.—The greatest capture of prisoners of war in modern history, up to the occurrence of the present war in our own land, was that made by the first Napoleon at Austerlitz, where that great conqueror took 20,000 prisoners. Gen. Grant's capture of prisoners, at Vicksburg, was, in round numbers, 31,000. Napoleon, at Austerlitz took 151 pieces of artillery. Grant, at Vicksburg, is said to have taken 238. Measure it how we may, the present War of Rebellion, exceeds in dimensions, all which have preceded it. It is the most gigantic conflict that the world ever beheld and the principles and consequence involved are fully commensurate with the magnitude of the contest.

THE Quicksilver mining company at New Almaden have now 150 men employed in extracting ores, from a depth of 500 feet.

Washington Street. Persons desirous of a respectable  
home will do well to apply. jy8

# THE BRYAN BATTERY.

The vast interest involved in the reduction of area on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twenty  
years, has been set down as a failure. The Ordinary  
Stamp Battery

## ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

## METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

## EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

## EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ties. They are adapted to

## BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect unit—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1860, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds, and  
the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,  
San Carlos Mining Co., Owen's River,  
Union Quartz Co., Aurora,  
Triunfo Mining Co., Mexico,  
Napa Quartz Co., Aurora,  
Petaluma Quartz Co., Gold Hill,  
Francis Mellus & Co., Slate Range,  
W. R. Churchill & Co., Mexico,

**TO QUARTZ MINERS.**

**All persons interested in Mining Ma-**  
achinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centre and passes under it, between the grinding sur-  
faces, to the circumference; from whence it passes again  
over the muller to the centre, through the holes and be-  
tween the grinding surfaces to the circumference; and so  
on, bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.  
No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.  
A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the parties infringing. My Amalga-  
mators can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.  
sep21 THOMAS VARNEY.

## REESE RIVER CORRESPONDENCE.

AUSTIN, SEPT. 29, 1863.

ED. MINING AND SCIENTIFIC PRESS:—I have just got up from the universal mountain-fever, and have had but little time to look around me for facts, the signal feature in your enterprising journal, but such as I have, I give unto you.

I think you have already a just appreciation of the vast mineral resources of this district, and perhaps it would be superfluous to repeat them.

The rush here, is beyond precedent, and the cry is, "still they come." The accommodations do not keep pace with the demand, and many are compelled to take such quarters as would only do honor to a sheep-fold. Buildings are going up, such as they are, on every hand. We are sadly deficient in building material. All our lumber is brought from Carson, 180 miles westward, and readily sells for \$300 per thousand feet. Adobe bricks, made on the ground, sell at \$13 per thousand, and constitute the cheapest building material we have, but in the long run, may prove the most expensive. We have plenty of wood for fuel purposes, sufficient to last for some years. Stone buildings are going up as fast as workmen can be found to raise them. Teams are crowding in, loaded with merchandise, provisions and lumber, but if the rush continues unabated, we shall look for a scarcity before Spring.

I have made some personal examinations of the mines, and pronounce the ledges innumerable and exceedingly rich. So far as I have examined, the ledges are narrow but invariably improve as the depth increases.

I have seen a number, back of Austin, and the maximum do not exceed five feet. The Enterprise is down five feet, Toro 15 feet, Roderick 30 feet, Rough Diamond 10 feet; all about the same quality of rock, ledges narrow, but expected to improve as developed. Garibaldi; quartz one inch thick, but enclosed with good thick casing and promises well. Die Vernon Ledge is good, three feet wide. Depth of incline 58 feet. Morgan & Muncey, in the same locality, is down 100 feet. Ledge only eight inches but rich. Ethan Allen—tunnel 100 feet. Ledge, 18 inches wide, with good looking quartz now stripping the ledge. Manhattan Company's incline is down 30 feet—ledge from four to eight inches of good rock. They have started another tunnel, further down the hill, and have gone in 16 feet. Oregon, near the latter, is down an incline 160 feet, and have reached water. The rock looks rich, with a similar cast as the Savage. Virginia. I was much pleased with this mine, as the work is going on well. They use a flume. It is said, the Manhattan Company claim this ledge. Whether they have any just claim or not, I am unable to say. Southern Light is working an incline—ledge three feet wide. Savage Company has a shaft 45 feet in depth. Their ledge is three feet wide, containing good rock.

In the cañon, between Clifton and Austin, there are four five-stamp mills in active operation, but deficient in pans. Two more ten-stamp mills are going up—machinery on the ground. The expenses here are enormous. Let him who expects to visit this country, calculate to pay four prices for everything he orders, and bring along a surplus of the "needful," for ten to one, he will have use for it.

There is a good deal of sickness here, principally of the mountain fever type, which is manageable if taken in time. Meet it with a strong will and plenty of blue mass and you will be all right in a few days, at least, such was my experience.

Ocr. 22:—I visited the Yankee Blade district, located in a north-westerly direction from this place, about three miles distant. Of this noted ledge, I regret that I was unable to reach the best rock, now under water, but I saw some taken from the bottom of the incline, which is 75 feet deep, and it corresponded with a lot of fifty tons, now at Brook's Mill, undergoing the process of crushing, and I was informed by Mr. Brooks, himself, that it yielded \$200 per ton. About 12 feet from the water, they have commenced drifting with the ledge which is a perfectly decomposed quartz; said to be rich, but quite limited in width. The two ledges in the incline are but a few inches apart; said to have united below the water, forming a ledge six feet wide. If that is the case, their prospects are highly flattering. The prospects of this mine, have induced hundreds of adventurers to try their luck in that locality, and many are elated with the results; but how many on the other hand are disappointed, is best known

to themselves. It is seldom a man blows from the big end of the trumpet, and the public to know the facts, must wait until they are revealed by time.

The Whitlatch Company has made the first extension south and are down 12 feet.

Cicero Company have an incline thirty feet down, and are taking out good looking rock. I could not go down on account of the blasting, therefore I cannot give the width of the ledge. The claim is held at \$75 per foot, but I presume the most obstinate holder would yield to less seductive influences than these figures might offer, as man is frail, and gold is a great tempter.

Bunker Hill, said to be held by the Yankee Blade Company, is down 12 feet; ledge 20 inches wide—work suspended. The rock is about the average.

Seely Co., Pizaro ledge, down fifteen feet. Ledge five feet wide.

Golconda Tunnel Company, in San Francisco cañon, have their tunnel in 50 feet—work suspended. San Francisco cañon is about three-quarters of a mile from the Yankee Blade, in a northerly direction.

Ruby Company, located near by, has sunk an incline 50 feet, and reached water. As far down as I could go, I found the ledge 3 feet wide. I saw some splendid rock taken from below water-line. I understand this Company is being incorporated.

"VIDI."

## THE NORTHERN MINES—NEW DISCOVERIES.

The Dalles (Oregon) *Mountaineer* states that the mines east of the Cascades are now sending to the market of the world an aggregate of \$1,000,000 monthly, or \$12,000,000 per annum. This statement is probably somewhat exaggerated, although the past year has witnessed a large increase of treasure shipments from that quarter, and indications are that we may look for still further improvements in that direction. New and rich diggings are claimed to have been discovered in upper Oregon, and a party of miners, headed by the discoverer, started a few weeks ago for a more thorough prospect. The mines are known as "Sinker Creek." With regard to these mines, the Dallas *Mountaineer* gives the following:

A tradition has been current for years that some lost immigrants, in 1845, whilst wandering through the country drained by the Malheur, discovered mines where gold could be raked up by the shovel-full. At the time the discoverers were ignorant of the characteristics of gold in its native state, and accordingly they passed on, regarding the metal as worthless. A few years later, some of these men were attracted to California, and on visiting the mines there, almost their first remark was that they "knew where bushels of that kind of stuff was to be had." Since that date scarce a year has passed that did not witness the departure of companies of men who went out for the purpose of discovering the country described by the immigrants. These exploring parties have uniformly proved failures, owing, in a great measure, to the hostility of the Indians, who have resolutely refused to allow the white man to prospect their country. At last, however a party more fortunate than the rest have succeeded in finding the long lost gold field, and if reports are to be believed, the story of its richness has not been exaggerated by the original discoverers. The "prospects" show that the immigrant boy was not particularly out of the way when he used a piece of native gold as a sinker, in a country where the treasure is so plentiful that it meets the eye at every turn. Connected as this new discovery is with a tradition that has been current so long, it is not strange that it has been the occasion of great excitement.

## THE MINING SHARE MARKET.

The Mining Share Market during the last two weeks has met with material improvement, both in amount of business transacted and in the rate of shares. The Burning Moscow and Santiago have absorbed the largest amount of attention during the past week, for reasons which are fully given under their appropriate heads.

Ophir has slightly declined. The directors declared a dividend on the 6th. inst., of \$48 per foot. This stock has been unusually active for the past two weeks, having been chiefly taken on foreign account. To meet this new condition, which has been in gradual progress for some months, the Company has made arrangements, whereby its dividends will be paid in New York, by Eugene Kelly & Co., No 36 Wall street, the same day as at the Company's office in San Francisco.

Gould & Curry has declined \$50, with small sales, though freely offered. During the past ten months this Company

has divided \$1,350,000 among its stockholders, equal to \$1.022 per foot: in addition to which, besides paying current expenses, the Company has made extensive and costly improvements both at their mine and mill.

The Central still remains inactive—buyers \$2,200, holders \$2,400. It is reported that the Company has recently struck a ledge in their main shaft eleven feet in width.

Chollar which closed the week previous at \$900, b. 30, advanced during the past week to \$1,050, but finally closed at \$980.

Potosi has been enquired for at an advance of \$100 over the week previous without finding sellers. This Company has recently struck very fine ore, the best ever found in the mine. We presume, from the firmness of holders, it is found continuous.

Hale & Norcross has found buyers at \$200 over offers of the previous week. This Company is making extensive improvements at the mine, which when completed, will make it second to none in facilities for raising large quantities of ore.

Imperial and Overman have each advanced somewhat with light sales.

Sierra Nevada has been but little dealt in; opening at \$100, closing at \$95. The hoisting works of this mine were started about ten days since. The Company has done a vast amount of work within the past ten weeks.

Dany has slightly advanced, with considerable business. A new 80 horse power engine arrived at the mine, on the 30th. ult., to be used for hoisting and pumping.

Burning Moscow has been the chief speculative attraction of the week and has been largely dealt in. Sales of 701 shares are reported. Opening at \$175, it fell \$164. Accounts of a highly flattering nature having been received from the mine, it suddenly advanced to \$310 on 30 days. The ores now being taken out are said to be beyond the disputed ground, and it is anticipated that the company, with present prospects, will be able to remit \$25,000 weekly.

North American has suddenly become unusually active. Sales of 704 shares—one eighth of the mine—are reported the past week, at a somewhat fluctuating advance from \$62½ @ \$71, closing at the latter figure with a heavy market.

Buckeye has met with a large demand, at fluctuating rates, closing at an advance of \$4 over last quotations.

North Potosi is again in considerable favor with large transactions.

Baltic advanced \$10 with large transactions.

Sacramento has been dull at \$60. This mine has been consolidated with the Meredith and will hereafter be known as the Sacramento & Meredith.

Spanish No. 2, has been in request at \$45, on 30 days.

Santiago stock shortly since was considered a very good investment at \$175 per foot, has fallen to \$15. Sanborn & Co's Circular of Saturday, in alluding to this mine, says:—

"The high price was based upon the returns from the mill of over 600 tons of ore, which yielded, on an average, \$40 per ton (as good as Gold Hill). [?] This ore, the Superintendent represented as being the average of the ledge. Upon this the price advanced to \$175; and one of the Trustees, an intimate friend of the Superintendent, and who held a large interest, sold out nearly all his stock to first class operators. Later runs at several mills, only produced \$13 @ \$17 per ton. Hence the cave-in in prices; no more of the \$40 ore being forthcoming."

We refer to our usual quotations and sales of the week.

ESMERALDA.—Wide West has advanced from \$67 to \$75 in this city, with considerable demand. This Company is now running its mill on Real del Monte rock; meantime work is going on at the mine, preparatory to further facilities for getting out ore.

Pond is not quoted—there being no stock in the market. The company is actively engaged in operations at the mine, 80 men being there employed. They have now three mills employed crushing their ore—the Brodie, Union and Gregory's mill. Sixty-five tons of ore from the ground in dispute between this company and the Del Monte recently crushed at Winter's mill yielded 1,140 oz. amalgam, worth \$8,464. One hundred tons at the Brodie yielded 2,500 ounces.

## COPPER.

The copper interest manifests no abatement. Notwithstanding the fact that we have as yet but one dividend paying copper mine, (the Union,) within the State, and that an unincorporated company, there is, nevertheless, no lack of confidence in the success of many of the leading mines now in

progress of development. The rule that holds good with gold and silver, where perhaps not one in ten of the actually remunerative mines will ever pay a dividend on an investment, will also obtain with copper. Hundreds of copper mines will soon commence shipping ore, in quantities and qualities that will pay the working proprietors, but which can never advance to a standard of a unit of value per foot on Montgomery street. This class of mines, under our California system of mining, will doubtless furnish the chief aggregate of ore, which will soon swell the copper yield of this State to a primary importance among the productions of the Pacific Coast.

Dividend paying copper mines will come into existence, slowly, and only under a most careful, thorough and economical system of development. Washoe has been now four years in progress of development, and can show as yet, but about 4,500 feet of dividend paying ground. Yet what Californian can be found without the fullest confidence in that as one of the richest mineral regions on the globe? If we add to the list only two or three dividend paying mines per year, Washoe will still continue to retain her pre-eminence as a mining region, and increase rapidly in population and wealth.

Shipments of copper ore are still coming in. A late number of the Grass Valley National predicts that at least twenty-five copper claims situated within fifteen miles of Grass Valley, will be shipping ore before the first of next November. If the conditions of the roads are such that ore can be hauled in January, our own knowledge of the mines in that vicinity would lead us to believe that the National's prediction will be verified by that time surely—perhaps before. We have but little doubt but that shipping ore, in considerable quantity, will find its way into this city or Antioch from one hundred mines by the opening of the coming Spring. Nearly, if not quite all of this ore will pay expenses of mining and shipping; yet we do not expect to count more than a dozen dividend paying mines within the coming twelve months.

## VIRGINIA CITY STOCK LIST.

**FIREMEN ATTENTION!** In our advertising columns will be found a card for Mr. J. D. P. Wilkins, of Stockton, the celebrated harness maker. Mr. W's hose, has long been used by the Fire Companies of San Francisco, and we believe, gives entire satisfaction. There is no doubt, it is a very superior article; and, we cordially recommend it to our numerous friends of the Fire Brigade of this city.

**PATENT CLAIMS.**—We will furnish, on application, the claim of any invention that has been patented within the last fourteen years. The name of the patentee—date of patent, when known, and two dollars for copying should be sent.

**MODELS.**—Inventors will please attach to all models sent to us, their names and address, in a legible, permanent form, this will avoid confusion and prevent errors.

**DRAWINGS.**—We have highly talented and efficient Draughtsmen, by whom drawings of every description are executed in the best style of art, with promptitude, and at a moderate cost.

#### WANTED

By a competent person, the Secretaryship of four Mining Companies. Books to be kept at the Office of the Mining and Scientific Press, No 57 Government House. Enquire as above. oct5

#### AGENTS WANTED.

We want a good Agent in every city, town and settlement, on this Coast. Applicants will send their names with reference, when specimen numbers of the Mining and Scientific Press will be forwarded to them, and their names added to our published "List of Agents." EWER & SMITH.

#### PARTNER WANTED.

The Proprietor of one of the oldest and most profitable country newspapers in the State is desirous of taking in a partner. He wants to dispose of one-half of his office to some gentleman well calculated to take charge of the editorial department, as he is a practical printer himself. For further particulars enquire at this office. oct4

[CORNER OF MERCHANT,]

SAN FRANCISCO.

#### WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 2016-1f ZENAS WHEELER.

#### Wm. P. TAAFFEE,

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

SECRETARIES! ARE YOUR ASSESSMENTS

**REYNOLDS' Patent Cut-Off and Governor, FOR STEAM ENGINES.**

127 of these Invaluable Machines, ARE NOW IN USE in California and Nevada Territory, giving a perfectly regular motion and Saving 20 to 65 per cent of the Fuel.

**Steen's Improved Governor** is the CHEAPEST, SIMPLEST and QUICKEST to set and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street, San Francisco.

**Clark's Steam and Fire Regulator,** For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to a pound, on the square inch. It cannot get out of order and any person can put one up in an hour after the damper is put in.

**Ingersoll's Patent Drill Press,** With which drilling can be done the same as with the common ratchet, and when small holes are wanted, it can be done four times as fast. The handle can be worked in any direction.

**Felt for Steam Boilers, Pipes, Etc.** At the lowest market rates.

**Steam Engines, Boilers, Pipes,** Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest market rates.

**Anti Incrustation Powder,** Save Remedily for Scale in Steam Boilers, without injury to the iron. In use for the past EIGHT years. Refer to—Sugar Refinery, San Francisco, Cottrell & Co., San Jose, L. A. Booth, Esq., Virginia City, and 2,000 others in the United States. **E. T. STEEN AGENT.** No. 33 Fremont Street, San Francisco.

**MOYNIHAN & AITKEN, Boiler Makers and Blacksmiths,** Mission, between Beal & Fremont Sts., San Francisco.

**N. B.** All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms.

**PUMPS!**

**HARRISON'S California Lift and Force Pump,** WITHOUT VALVES OR PACKING, Suitable for Mines, Fire Engines, Wrecking or Irrigating. This is the Cheapest, Lightest and most Durable, and least liable to get out of order, of any Pump yet invented.

**ALL SIZES;** Capable of throwing from ONE HUNDRED to FIVE THOUSAND Gallons per Minute—For sale by

**C. H. HARRISON, PHOENIX OIL WORKS,** 617 Front Street, San Francisco.

**50 lbs. MARINE and Fire-Proof Paint,**

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, iron ground. Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks of Bottoms of Ships, it is equal to a coat of Stone, and will equal to Copper, no worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:** For Decks of Ships, use two parts Mineral Paint, one part White Lead, mixed with Linseed Oil. For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply hot. For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.** When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:** HOUSE—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: If a lighter color is wanted, mix with more lead. ROOF—Five parts of Mineral Paint, one part white lead; mix with Linseed oil. Put it thick on a tin Roof, one coat when properly applied will last three years. **S. C. BRADSHAW, Agt., G. T. TORQUET, Superintendent.** **WORKS, North Beach; Office, 509 Sacramento st., San Francisco.**

**PALMER, HANSCOM & CO., GOLDEN STATE IRON WORKS,** No. 19, First Street, San Francisco,

Furnish Castings and Machinery of all kinds ALSO: GENUINE WHITE IRON SHOES AND DIES. PALMER, HANSCOMB & CO.

**To Quartz Miners.** **Knox's Improved AMALGAMATING PAN,** WITH PALMER'S PATENT STEAM CHEST.

THE ABOVE COMBINATION SECURES THE MOST complete amalgamation of the precious metals of any process now known. By its steam is introduced in the most effective and economical manner, while it is peculiarly adapted to the catching of floating gold and silver, known to be other wise lost. Made exclusively by PALMER, HANSCOMB & CO., GOLDEN STATE IRON WORKS, Nos. 19 & 21 First Street, San Francisco. The public are informed that Letters Patent have been granted the undersigned upon Steam Chest False Bottoms for the inside of Amalgamating Pans or Tubs, and are cautioned against making, buying, using or selling the same without his consent. **W. A. PALMER.**

Pick Eves of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name. **JOHN WRIGHT, 511 Market street, Opposite Battery, San Francisco.**

**CALIFORNIA TOOL WORKS! John Weichhart, Manufacturer of All Kinds of Edge Tools, Etc.,** Plane Irons Moulding Irons, Stone Cutter's Tools, etc No. 22 Fremont street, bet Market and Mission San Francisco, July 14, 1863.

**VALID? A correspondent suggests the enquiry whether advertisements of assessments are valid in which the name of the Company is not given in full: i. e. in which the district, in which their leads are located, is omitted. At present many advertisements may apply to many companies.**

**NEW FIRM IN VIRGINIA.**—We would call attention to the card of MESSRS. ARMSTRONG & WILDER, of Virginia City, which will be found in another column. A long, personal acquaintance with Mr. Armstrong, warrants us in assuring our readers that whatever business is entrusted to this firm will be correctly and promptly attended to.

**THE REFUGIO MINING COMPANY.**—We have received the Prospectus of this Company recently organized for working "Nuestra Señora del Refugio" mine in Chihuahua, Mexico. We shall notice at length next week.

**RICH COPPER.**—Mr. J. T. Taylor, Postmaster at Taylor's Ranch, has submitted some very rich specimens of copper ore to our inspection, from Plumas county. The "Green Ledge," located in Genesee Valley, besides being very rich in copper, also contains a large amount of gold. The rock is now being worked in arastras, which yield about \$25 to the ton. The lead is of most unmistakable value. Mr. Taylor also exhibited specimens from the Mountain Meadow ledge, which shows large quantities of native copper. This ledge also contains gold and frequently shows native silver. A tunnel is now in 300 feet which at 500 feet will strike the ledge over 500 feet in depth.

**Eye, Ear and Throat. DR. DE CASTRO, Oculist and Aurist,**

**WHO HAS PRACTISED IN NEW** York and all the principal cities of Europe with such unrivalled success, and from each place in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. Deafness of long standing thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**Self-adjusting Artificial Tympanum,** For the relief of deafness, attended by loss or injury of the membrana tympani, and for the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on 30th of November, 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state; the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

**33. Mr. Editor—Having been afflicted** with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent one operation, and it was with the utmost pleasure I can say my hearing was fully and without pain restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist. **JOHN REESE, Napa Valley.**

**James Callaghan, witness.** San Francisco, July 30th, 1863.

[From the Daily Alta.] San Francisco, June 30th., 1863.

**ED'S DAILY ALTA:** Permit me through your widely circulated journal, to say, that my daughter Mary Ellen has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearny and Market Streets, and undergoing under his direction, two operations, she has heard sounds very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, I think, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physicians and aurists in California, but up to the period of visiting Dr. De Castro, received no benefit. **—CHAS JOHN P. WRIGHT, 812 Green Street.**

## MINING NOTICES.

**Silver Butte Consolidated Silver Mining Company.**—The regular annual meeting of the Silver Butte Consolidated Silver Mining Company will be held at the office of the Company, No 528 Montgomery street, on FRIDAY EVENING, October 30, 1863, at 7 1/2 P. M., for the election of officers for the ensuing year. A punctual attendance is requested.

## MINING &amp; SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings of new inventions, etc., prepared expressly for its columns. This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news pertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patents with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects and Millwrights. This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers.—Four Dollars per annum!

## Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

## MINING & SCIENTIFIC PRESS.

### THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1882. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns. This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

**The Inventor!**  
 Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patents with dispatch.

**The Mechanic and Manufacturer!**  
 Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

**Terms.**  
 To mail subscribers.—Four Dollars per annum!  
**Club Rates.**  
 Five Copies for Six Months, \$9.  
 Ten Copies for Six Months, \$16.  
 Ten Copies for Twelve Months, \$30.  
 Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

**EWER & SMITH, Publishers,**  
 Room 57, Government House, Corner of Washington and Sansome streets, San Francisco.

**A. C. MORSE,**

**All kinds of Designs for Building.**  
**R. W. MYERS. H. C. SOMES**

## OUR MINING DIRECTORY.

We devote nearly the entire of to-day's issue to our Mining Directory. We have added to the list about 300 companies, removed about the same number of such as we have heretofore been giving by their titles only; their Secretaries not having considered their existence of sufficient importance to the public to hand in the locality of office, etc., for insertion in the Directory. In addition to the above changes, we have made several hundred corrections and changes—the most of which we have sought out by diligent enquiry.

ESMERALDA STOCK MARKET.

There is but little change in the Stock Market since the last report from this District.

The Lexington Ledge, on Last Chance Hill, is again being worked, the new shaft is down to a depth of 60 feet; the ledge is over six feet wide, and the rock increasing in richness. The company have about forty tons of rock taken out, lying at the shaft, ready to be crushed, so soon as a mill can be secured. The rock is said to be equally as rich as the Crckett or Western summit.

The work on the Clan Alpine Ledge, on Last Chance Hill is being prosecuted day and night; the shaft is now down to a depth of sixty-five feet, and the company are drifting on the ledge—fourteen tons of the rock crushed at Lake's mill, on Wednesday, yielded \$1,382. The company have declared a dividend of \$1.50 per share on the 38 tons of rock crushed at this mill. The work will be continued, but no more rock will be crushed until the present contract of this mill on the Pond rock is completed.

The Clan Alpine Company are sanguine that the next crushing on their rock will go over \$90 per ton.

We are compelled to defer our usual Mining Stock Report for the week. Considerable changes have taken place in the market, for which we refer to our usual lists of sales, for the week.

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, OCTOBER 26. 1863

NO. 52.

## REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

## THE ANTIOCH COPPER SMELTING WORKS.

We are informed that the California Copper Smelting Works are progressing favorably; of course the superintendant has to experiment to a certain extent upon some of the refractory materials used in the construction of some portion of the furnace. We are told, however, that so far everything looks like a complete success. The Company also seem to be satisfied with the obtained results, and a proof of that is, that another very large furnace is in the course of erection, and in about ten days will be ready for working. We see no reason whatever, why copper smelting will not be a safe and profitable investment as any in California. We have an abundance of coal which will answer the purpose of copper smelting without a doubt. Parties can obtain coal as cheap here as they can in most of the Eastern States; copper works and the copper ore are much cheaper. Our own requirements for copper will be pretty considerable, and is already quite large. We shall be pleased to see the California Copper Smelting Works supplying this demand. On the strength of this, other large manufactories will start into existence—such as the producing of the various copper impelments and apparatuses for manufacturing and domestic purposes. We can all look forward to the production of brass. The success of this enterprise cannot be over estimated, and it deserves the aid and good will of every Californian. Why cannot California supply the demand for copper of China and various other places. In such a large seaport, considerable sheathing will be required for ship bottoms, and cannot we expect the Antioch Copper Works to fill this want, at some day, early in the future. The Company will soon have a few tons of manufactured copper ready, although at present they have in view only the concentration of the ores, so that none may have their works assaying less than 50 per cent. of copper. When these works are in full working operation, copper mines that will not pay now, can be worked to an immense profit. Mines producing even five per cent. of copper will eventually pay. They would pay even now if parties were to put up machinery on their works, and dress their ores; and until this is done, copper mining can not be profitable in the majority of the mines of this State.

[From our Traveling Correspondent.]  
COPPEROPOLIS.

MR. EDITOR:—I have now commenced in earnest the business of my special mission; and as one of its principal objects was to collect all the information I could of this wonderful district, which might be interesting to the community at large, I shall begin with a short notice of the town itself. Copperopolis is situated some thirty-five miles above Stockton, a little south of east, six miles from the Stanislaus River, opposite the Central Ferry. The main travel, however, to Sonora and Columbia, and that section of the country, passes over — Ferry, where they are building a magnificent suspension bridge, at a cost I understand, of \$20,000.

The town stands upon a site admirably adapted for the large and important city it is destined soon to become. Its present dimensions, indeed, are quite respectable, considering it is only two years old. Amongst its principal buildings are Col. Manning's hotel, a large, commodious house, conducted admirably, and affording better accommodations than you get at Stockton; where, by the way, in this respect, they are sadly behind the times—the Catholic Church, Mr. Hardy's private residence, and the public works of the Union and Keystone mines. There are also two livery stables doing a good business, several large stores, Ice Cream Saloons, and about the usual amount of bars, though so far as I have seen, the people, for a mining town are very temperate.

The population, I believe, is about twelve hundred; amongst which the Cornish and Irish miners form quite an item. There are two schools, one public and one private, with about an equal number of pupils; and the general Sabbath-school, with an attendance of 60 children on an average. I do not know whether they have a resident minister, but as a matter of course, there's a Doctor and a Lawyer. The latter are inevitable everywhere. I was rather surprised to find the Protestant residents have not built a suitable place of worship, considering the population, and the permanency of the mines; but, at present, Divine Service is held in the public hall, a respectable building, standing in the centre of the town, which also answers for theater, ball-room, etc., as occasion requires.

The valley through which these rich and extensive copper deposits run, is surrounded with hills well timbered, and containing a soil capable of producing anything. The great drawback to agricultural pursuits at present, is the scarcity of water; but, to obviate this, a large company have commenced a tunnel into the high hill on the upper side of the town, with a view, principally to strike water, and, if successful, as no doubt they will be, then Copperopolis, in this respect, will very soon be a second Coloma, where every man sits literally "under his own vine and fig-tree."

## THE MINES.

To visit each mine separately as I intended, and to render my description intelligible to strangers at a distance, is a work of labor, consuming considerable time. I am however, making all possible progress, consistent with its importance, and, here perhaps, is the proper place to acknowledge the extreme politeness and consideration with which all parties treat me, and the assistance they afford. Whenever or

where I want to go, there's a buggy at command. At the fitting time, as in gratitude bound, I shall mention each party by name. On presenting friend Elmore's introduction to Mr. Pike, Wells, Fargo & Co's agent here, he arranged immediately to have a conveyance for me the following morning; when accompanied by Mr. Johnson and Col. Manning, we all started to visit the Massachusetts, but as this mine is not upon what is called the Copperopolis lode proper, I shall omit its description now in order to avoid confusion. At present I shall confine myself to those stretching from the town to the river, a distance of six miles, and give them, *seriatim*, as they follow in succession. First then comes

## THE UNION.

Of this claim I am unable to give any particulars as the authorities, for reasons best known to themselves, refuse admission. All I can say is, that a portion of it runs out from the town towards the river until it joins the

## EMPIRE.

This mine stands high. Their main shaft is about 110 feet deep. Its extent is 1,800 feet, containing twelve shares. At present they are not at work below, so I did not go down. In a short time, this will be one of the leading claims.

## CALAVERAS.

This mine follows in a direct line upon the main lode, and in the advancement of its works, stands next to the Union and Keystone. It is almost incredible, the amount of work done upon this claim. It contains 3,000 feet divided into twenty shares. The main shaft is about 110 feet deep. Over this shaft they have put a splendid little engine of 20 horse power, with 10 inch cylinder and 1½ feet stroke. The engine is intended for hoisting ore, and pumping. The pump will be a plain lifting pump about 8 inches in diameter. All these works will be completed very soon. The machinery was manufactured in Stockton, and reflects great credit upon the Globe Foundry. In sinking an air shaft, about 100 feet above the engine house; they recently struck a magnificent deposit of ore at 30 feet deep, which was reported at Stockton to contain 30 per cent. sulphurets. I forward three samples of this ore, for your cabinet collection, which I picked up this morning, out of a large pile equally good. For three long years, the owners have had untiring faith in this claim, and like all faith accompanied with good works, it will reap the final reward of success.

## COLUMBUS.

Yesterday Mr. Beardsly very kindly offered to drive me round. Our first visit was to the Columbus. This claim is only just opened. They do not expect to strike anything of consequence until 100 feet deep. They are now down about forty feet, with strong indications of good ore. The claim contains 2,400 feet divided into 16 shares. I think myself that thirty feet more of tunneling will make quite a difference in the value of this claim.

## PLYMOUTH ROCK.

This claim is also only opened. It consists of 2,500 feet, divided into 18 shares. They are down 40 out of 150 feet which they expect to have to sink. Indications good.

## COLYER.

Immediately opposite the Plymouth and adjoining is the Colyer, only a few hundred feet apart. Both are prospecting

THE ALTA CALIFORNIA Copper Mine is located in Del Norte County, about eighteen miles from a good shipping port. It was incorporated in 1860. It has an incline 250 feet deep, and is now shipping 20 per cent. ore. It is one of the most promising mines in that county.

for the main lode, with equal chances of success, as through this point it is difficult to guess the exact bearing. The Colyer takes the flat. The claim is 1,200 feet I believe. At present no work is going on, owing to the accidental death of Mr. Colyer, a short time since, from a premature explosion of a blast.

#### WEBSTER & ALTA CONSOLIDATED.

Next follow these two claims, also running parallel and directly opposite to each other, like the preceding. Neither are working below. The Webster people were driven out by water and are now driving a tunnel. The Alta suspended work from some misunderstanding about assessments. I did not learn the extent of the Webster; the Alta Consolidated is 3,000 feet, divided into 20 shares. Like the preceding two, no one can tell which will win the prize.

#### SAXON.

My ride with Mr. Beardsley terminated at this claim. It is also just commenced, being only 30 feet deep. It contains 2,400 feet, divided into 15 shares. Mr. Binnex, the Superintendent, is doing splendid work; he is both practical and intelligent. From indications, and bearings of the compass, the Saxon think they will come on the lode, when they get down 100 feet. I shall go down this shaft some other time. I am anxious to do so, because if they prove correct in their judgement and strike the Copperopolis lode, in what light are we to regard the splendid lead already developed by the Table Mountain claim, one fourth of a mile west of the Saxon, and the last in this line before reaching the river.

#### WIDE WEST.

Parallel with the Saxon, and adjoining the Table Mountain, is the Wide West. It contains 3,000 feet, divided into 20 shares. They calculate to sink 100 feet, and then drift East about 30 feet as directed by the Table Mountain, of which indeed, it is an extension. At present they are only down a few feet.

#### TABLE MOUNTAIN.

Although I visited this splendid mine on Saturday with Mr. Pike, this is the proper place to notice it, as on the Copperopolis range proper, it is the last claim toward the river from the town, in the direction I have so far taken. Although last mentioned, for many reasons, it is the first in importance. Table Mountain is between 5 and 6 miles from town, nearly south east, and about one mile from the Stanislaus river. The claim consists of 2,150 feet in 21 shares. They have two shafts, one 120, the other 40 feet deep. In the latter they have a magnificent lead 4 feet thick; in the former, they were some thirty feet east off the lead, from this they are now drifting and have about 10 or 12 feet more to go. They are working day and night—employing fourteens hands.

Out of the 40 feet shaft, they took 12 tons of No 1 ore. I sent you two splendid pieces of ore which I took from the bottom of this shaft. Apart from the richness of the lead developed in this shaft, it has importance from the fact, that it varies from the direct line of the Union lead taken by Professor Whitney, who invariably places the Saxon on the direct line. What then is the inference? That in instead of one direct copper lode, running through this valley, there are two, or else the Professor made a mistake of one fourth of a mile, and the Table Mountain, not the Saxon, is on the main lead. Whichever proves true in the end, it is at present of great consequence to the intermediate claims still undeveloped. I have, however, something further to say about the Table Mountain. It was a matter of notoriety on Montgomery street, before I left, that the Table Mountain stock was depreciated 15 dollars a foot, having fallen, I think, from 40 to 25 dollars. However this came about, personal observation assures me, it was a gross injustice. There is not a better developed lead, at 40 feet, in this district, than Table Mountain, and the samples I send down, which I picked off the solid rock, indiscriminately, at the bottom, proves this fact. I mention this truth, only in justice to the district; and because the stock being a marketable article, the public at large have a right to know the truth. My opinion is that those who buy this stock at \$40, buy very cheaply indeed and lay the foundation of a nice speculation.

These claims I have spoken of however, including only a portion of the Union are but a tithe of those in the district. They simply embrace those located on the right of the town, leading to the river. I am just going out again in the opposite direction with Mr. Lyons a gentleman from Mr. Honingsberger's establishment, and shall continue my reports until I have inspected all.

L. H.

Copperopolis, Oct. 15, 1863.

[From our Special Correspondent.]

#### COPPEROPOLIS.

MR. EDITOR.—My first letter upon the mines of this district embraced those of what I shall call, or the sake of distinguishing them, and making their exact locality more readily understood, the first division—that is, those stretching from the town on the right-hand to the river Stanislaus, and supposed to be on the celebrated Copperopolis lode proper.

Since that letter, I have received a continuance of civilities from the residents of this hospitable town, being in fact kept traveling round nearly all the time. Your old friend, Mr. S. Johnson, invited me to spend a few days at his place, to inspect the Eureka and Elizabeth Consolidated, the Argentine, and the Hope, all being under his superintendence. I cannot speak to highly of his polite attentions. On my return, I paid a flying visit to the Napoleon, where I was cordially entertained by the new Superintendent, Mr. Steinberger, who allowed me the use of his horse for a couple of days, so that I could be more unfettered in my movements. I was in the saddle to-day from eight A. M. to six P. M., and though somewhat fatigued—for I assure you, it is not very agreeable work, going down all these mines, sometimes by ladder, sometimes by rope, to a depth ranging from 50 to 200 feet—I, nevertheless, remember it is the night on which I must send you another communication.

The peculiar features of this region, as you approach it from the plains, have so recently been elaborately described by the Editor of the Press, it will be unnecessary for me to say anything more on that head, than that his account was geologically accurate, and that the entire belt, commencing at the Napoleon, and extending to San Domingo, a distance of 25 miles north, affords a most complete field for scientific investigation. The fact to me most incomprehensible is that this discovery should have been delayed so long, considering the number of men in this State, who have worked in the English and American copper lodes. In every rock and stone, in the gulches or on the banks, you can observe the copper hue, while in the croppings you will everywhere find carbonate of copper, frequently sulphurets, and sometimes native ore. Perhaps, however, it is most wisely ordained, that things are as we find them; that one discovery should follow another in due season, to stimulate the enterprise, and employ the energies of the people. A few years ago it was all gold, now it is all silver and copper; a few years hence, it will be all iron, lead and tin; and, when our necessities force us into further activity, we shall search for the latter metals in this vicinity, and find them in equal abundance.

But I must now give the result of my last week's inspection. The first on my list is the

#### MASSACHUSETTS.

You may remember I told you this was the first I visited. Its description I delayed because it did not belong to the range or location of those I gave, and because I was convinced on seeing it, that another discovery, as important as the Union was made, and I naturally desired to see the results of a little more work, before I spoke definitely of its merits. This mine is situated some six miles south of the town, on a range running parallel with those mentioned already, bearing from them on an air line with the Saxon and Table Mountain, about three miles west. This lode, distinct from the other, has somewhat peculiar croppings and bears a very straight course to the river. It contains 4,500 feet divided into 150 shares. There is only one shaft, (prospecting) down about 40 feet. The rock from the commencement has been very pure, and now yields ore sufficiently good for shipping. When twenty feet deeper, I think the vein will be twenty feet wide; while for richness, when fully developed, it will equal, if not surpass, the far-famed Union and Keystone. Adjoining on the North of the Massachusetts comes the

#### PACIFIC.

From Copperopolis, the Pacific is the first mine on this range. I mention it second because at present it has not the same importance as its neighbor. There is no reason, however, why it should not be as good. It contains, I believe, 4,500 feet divided into 30 shares. It will henceforth, I understand, be worked steadily. On the south end of the Massachusetts, going towards the river comes the

#### SWANSEA.

This mine once reached so high as to have a local value of \$15 per foot. Its valuation has fallen at present, but simply, in my opinion, from want of judgement or experience in

selecting the place to put the shaft down. For instance this mine, unquestionably valuable, has been worked for a year with no practical results as regards the vein, from this cause alone. The old shaft 70 feet deep is at last abandoned and a new one commenced under much more favorable auspices. I think the present shaft will develop something, though the site is not exactly well chosen. It contains 4,500 feet divided into thirty shares. The work will now be prosecuted vigorously. Next to the Swansea, and last on this range comes the

#### SCORPION.

This mine is nearest to the river of any, being almost on its banks. The same error of judgement has been committed here as at the Swansea, and their shaft, except for ventilating purposes in future, is entirely useless. They have gone down 120 feet, and intend sinking for two weeks more, although a long way below the vein, with an intention of drifting to the east to strike it. In my opinion, this is bad policy. They will have to run a drift at least 40 feet, and through so hard a rock that it will cost as much nearly as to sink a new shaft in the proper place. The rock hitherto raised carries an immense quantity of iron, and is generally corrupt. There is no doubt, however, the claim will ultimately be good. It contains 3,500 feet divided into forty shares. This claim is the wettest I have been into yet; water is generally very scarce throughout the district. From the river, on the opposite side to Montezuma, a distance of six miles south, this wondrous copper lead disappears altogether.

I must now take you in an opposite direction, to Mr. Johnson's. You leave town on the Sonora road, and go round some seven miles to get to his place, though really only four miles from town. I enjoyed myself much with him, for he's a splendid fellow. We had long political chats; he is a Union man of the first order. The principal claim is the

#### EUREKA & ELIZABETH CONSOLIDATED.

This claim contains 6,000 feet and is incorporated. The main shaft is down about sixty feet, with good indications.

When I was there they had a tremendous boulder on the bottom, but below that, as is often the case, they will find, I think, a very favorable change. On the same range comes the

#### ARGENTUM.

In this claim there are 3,000 feet, not incorporated, and I believe, principally owned by San Francisco men. The work has been suspended for some time, although the oldest claim on this range, to complete certain preparations, and will soon be renewed. Next and last follows the

#### HOPE.

There are 4,500 feet in this claim, not incorporated. The shaft is 35 feet deep through a very hard rock, but of a good character. Water is now appearing which indicates a change. All these mines are strongly developed. They lie in a direct line four miles north-east of Copperopolis, and the water of the entire district falls into the Calaveras River, not the Stanislaus. In the croppings, native ore is found. The mail is closing, and I must close. I desire, however, to say more of this range.

I find the Mining & Scientific Press, is appreciated here and subscribers are coming in. Tomorrow is the Judiciary Election, so I suppose I will get a day's rest.

L. H.  
Copperopolis, Oct. 20, 1863.

PACIFIC QUARTZ MINING COMPANY, GRASS VALLEY.—Grass Valley, Nevada county, has long been famous among California mining districts for her rich mines of gold, both in placer and quartz. The Allison Ranch mine is famous throughout the world over, and is generally set down as the richest gold mine ever worked. The Messrs. Watt & Co., on Massachusetts Hill, are working a mine which is probably not at all inferior in value to the Allison Ranch, and only about a mile and half distant. During the past two years a company known as the "Pacific Quartz Mining Co.," have been opening mine, almost directly in the town of Grass Valley, which to all present appearances, bids fair to rank fully equal in extent and yield with either of the two first mentioned. This mine has been opened to the depth of 300 feet below the bed of Deer Creek, which it crosses, and at a depth of 240 feet, gallery has been opened a distance of about 250 feet, the rock from which has proved of a richer average than that taken from any lesser depth. This gallery has thoroughly proved the value of the mine. About 2,000 tons of rock has been taken from below the water level of this mine, which has av

aged fully \$45 the ton, constantly improving, with its depth. The hoisting and pumping apparatus has hitherto been driven by a twenty-five horse power engine, which however, is now to be superseded with one of larger capacity. The stock of this Company is divided into 60 shares, none of which to our knowledge has ever changed hands. In addition to the three already mentioned Grass Valley possesses several others which are bid fair to reach the standard of first class mines. The Pacific Coast a pocket of special interest a few miles since, near the northern extremity of their lower gallery from which they took about \$10,000.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twenty years, has been set down as a failure. The Ordinary Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

### METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamp, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps,

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley, San Marcial Co., Mexico, John D. Winters & Co., Esmeralda, Crown Point Co., Gold Hill, Potosi Mining Co., Virginia City, Tajo Mining Co., Mexico, Sheba Mining Co., Humboldt, Lotta Mills Co., Coso, American & Mexican Co., Mexico, San Carlos Mining Co., Owen's River, Union Quartz Co., Aurora, Triunfo Mining Co., Mexico, Napa Quartz Co., Aurora, Petaluma Quartz Co., Gold Hill, Francis Mellus & Co., Slate Range, W. R. Churchill & Co., Mexico, Willow Springs Co., Coso, Hews, Howe & Co., Rich Gulch Flat, F. A. Benjamin & Co., Mexico, O. J. Parker & Co., Nicaragua, Gibbons & Clayton, Esmeralda, Smith & Clouser, S. F. Reduction Works, Amagoza Mining Co., San Bernardino,

## PEOPLE'S OPPOSITION Steamship Line!

Special Notice.—The Line have been withdrawn from the Nicaragua Route until further notice.

### GREAT REDUCTION IN RATES!!!

The Fast and Favorite Double End Steamship,  
MOSES TAYLOR,  
J. H. BLETHEN.....COMMANDER  
Will be dispatched for PANAMA  
From Mission street Wharf.  
SATURDAY, - - - - OCTOBER 3, 1863  
Punctually at 9 o'clock, A. M., on  
Connecting at Aspinwall, by the Panama Railroad, with the Splendid Steamship  
ILLINOIS - - - - - 2500 Tons.

The Moses Taylor, since her last trip has undergone the most extensive repairs. Her deck have been extended forward and aft; cabins enlarged, refitted and repainted throughout—making her accommodations equal to any Steamer on the ocean.

For further information or Passage, apply to  
I. K. ROBERTS, Agent,  
No. 407 Washington Street, San Francisco.  
Opposite the Post Office.

BOOK KEEPING,  
Penmanship  
AND  
COMMERCIAL CALCULATIONS,  
Taught by J. S. LUTY  
PRACTICAL ACCOUNTANT,  
305 Montgomery Street, Corner of Pine.  
TO QUARTZ MINERS.

All persons interested in Mining Machinery are invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds of ore at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circle on the face of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates. A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at Donahue's Foundry called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured.

## New Style of Ladies' Buckle!

W. BOHM,

INVENTOR AND PATENTEE.

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. It excels all other buckles in

### Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

118 1 Street, Sacramento.  
Agents for the Patentee.

Every Buckle sold, stamped "W. Bohm," will be guaranteed as to its Strength and Durability.  
je 27 W. BOHM, Patentee.

## THE OWEN'S RIVER REGION AND CANAL COMPANY.

It gives us pleasure to notice the vigor which the Owen's River Canal Co. display in the prosecution of their enterprise. Although the Company was only incorporated on the 26th. of last August, a large amount of the stock has been taken, and tools, provisions and camp equipage for thirty men, have been forwarded, via. Aurora, through which place, they passed some ten days since.

We have examined, at the office of the Company, in this city, the maps and surveys of the Country including the map as made by J. E. Clayton, of the line of the Canal, and showing many of the prominent lodes of the Russ and Inyo Districts.

From the best information we can obtain of the character of the mines and the many advantages they possess in the way of cheap facilities for working, possessed, as they soon will be, through this Canal Company, of an unlimited supply of water power at a mere nominal rate, this must soon become an important mining district.

As the Company proposes to charge only one dollar per stamp, running time, for motive power, it will be readily seen and understood that lodes paying not over \$20 per ton will be worked at a profit, or in other words, ores from all the mines can be worked to as low a grade as \$20 per ton. There are also other advantages which this country possesses over Reese River, Humboldt, Washoe, and Esmeralda, in the large amount of agricultural land in the valley of Owen's River, immediately adjoining the mines, and in the superior mildness of the climate, this region being neither so far south as to be burnt and scorched with heat, nor so far north, or so much elevated as to have snow to fall and lie over twelve hours after falling. Cattle remain in good condition, all the year round in the open fields; and the Winter is the most favorable season for work, and freights are taken at lower rates in the Winter by the way of Los Angeles, than at any other time of the year. Freights can also be taken at all seasons, from Visalia, at the same rates.

There is now a steady stream of immigration pouring into the valley, from all quarters. On Thursday of this week, a company of thirty farmers, mechanics and miners, connected with some large capitalists, of this city, leave Brooklyn or San Antonio, across the bay, for Owen's Valley. We have also heard of several smaller parties recently going forward.

De Bend City and San Carlos, the principal settlements in the valley, are being rapidly built up with stone and adobe houses of the most substantial character, while all the indications for permanency, show that this country is steadily progressing.

The people of that district have never as yet attempted to raise an excitement by newspaper articles, yet it's fame, and name is being spread abroad, and we look for quite an excitement and rush to Owen's River at an early day.

The Owen's River Canal Enterprise is one of the highest importance to that region, both as regards its mineral and agricultural development. To the miner it affords cheap and convenient power, and to the agriculturalist abundant facilities for irrigation where needed. By its cheap power, many mines which could never pay the expenses of steam, may be wrought with profit, and thus give employment to thousands of miners, which would not otherwise be brought into that region, to be fed by the farmers of the valley.

A small outlay only will be required to put the work in a sufficient state of forwardness, to get their sawmill in operation, the income from which ought to be nearly if not quite sufficient to construct the balance of the work within a reasonable length of time. As an investment, few schemes present a more favorable basis and the terms upon which its stock is offered are liberal in the extreme, as will be seen from the Company's advertisement in another column. We feel free to speak of this enterprise as we do from our favorable personal knowledge of its projectors, from the information within the reach of any one with regard to the feasible nature of the scheme, and from the fact that the undertaking is one of public interest, as an important initiatory step in the development of a large and valuable region of country, upon the extreme Eastern border of our State.

About two millions of treasure were received at San Francisco, from the interior, during the ten days preceeding the sailing of the last steamer.

## IMPORTANT DISCOVERY.

The discovery of a remarkable *Salt Spring* to the north of Virginia City was announced a short time since. More value should be attached to this discovery than it has generally obtained. Salt, apart from its domestic use, is an indispensable requisite to the reduction of the silver ores of the Eastern slope. At first the article was transported to Virginia City in large quantities from this city. Some two years since a large deposit of mineral salt was discovered in the Walker's River region, from which point the reduction works of Washoe have since been chiefly supplied. This deposit, however, is at a great distance from the chief point of consumption—some 180 miles—and for the most part over a very rough and heavy road. At a more recent date we have all heard of the wonderful salt deposit between Humboldt and Reese River. This latter discovery, however, is more remote from Virginia City than that of Walker's River.

The latest discovery, however, and the one to which we designed, more particularly to refer, at this time, is located about sixty miles north of Virginia City and some twelve miles east of the California State line, which latter fact induced the proprietors to name the location the Boundary Line Salt Works. This discovery consists of three springs within the circuit of a few feet, the waters from which may be easily connected. The main spring alone yields a regular flow of about ten or twelve inches, miner's measure. The salt held in solution by the water is equal to a fraction over one half its bulk and yields a salt chemically pure—a very important consideration, whether used for ore reduction or culinary purposes.

The chief value of this discovery consists in the facility with which it may be delivered in Virginia City and neighborhood, the point of chief consumption of the article on the Eastern slope. The springs are located near the Eastern foot of the Sierra Nevada range, and a fine natural road upon a level alkaline basin may be found nearly the whole distance from the springs to the Truckee Meadows, from which point Virginia City is reached over the Truckee Turnpike.

The proprietors contemplate the early erection of evaporation vats, when they will be able to lay down a superior article of salt in Virginia City at about half the present price of the article in that market, and still leave a large margin of profit.

LINE HOUSE MINING DISTRICT, }  
NEVADA CO., OCT. 18, 1863. }

MR. EDITOR:—I ask a place in your valuable paper for a few notes taken during my ramblings through this and adjoining mining districts. I find that the excitement of three months ago has somewhat abated, and that the owners of copper claims, (none others are thought of here,) have ceased running after new claims, and have turned their attention more to developing those already located; still there are a large number of claims that have been located but never yet prospected and now liable to forfeiture, whilst others have only done work enough to secure them. One hundred dollars expended upon a claim will hold it for two years.

Among the claims now being worked, I will mention a few. The Hooker is being worked with good prospects at the depth of about 90 feet. Stock in this Company is sought after by those best acquainted with the claim. "No Chance at All" is being worked with fair prospects; also the Mammoth which bids fair to prove valuable. The Last Chance is still at work with an improvement in the appearance of the Ore. They have sacked some but I believe have not yet shipped any. The Eureka Consolidated Company, on Green Lead, is at present taking out very good ore. The vein is increasing in thickness; they have a number of tons of first quality ore already sacked, and I understand intend to commence sending it off to-morrow, and will continue sacking and shipping as fast as ores are taken from the mines. The Still House Lead, on Bear River, is reported good. I have not yet seen it. The Well Claim is still being worked with very flattering prospects. After sinking a shaft over 50 feet, (49 feet of which was through solid ore, following the east or hanging wall,) they have run a drift or tunnel westward, with the intention of finding the west wall and thus ascertaining the width of the vein or ledge. This drift has been pushed through a mass of mineral for sixty feet, without yet striking the west wall, thus proving that the vein is at least 60 feet wide, with prospects of a still greater

width. The Company have already shipped about 180 tons of ore, and have a plenty left. They are now taking out and sending off ore as fast as teams can be had to haul it to Lincoln, from which place it is forwarded by rail-road. From outward appearance the Company are well prepared for a Winter's work, having a good whim by which they can haul all the ore and water out of the mines, with one horse, with ease, and the works are all covered with a good, substantial house to protect them from the rains.

There are a number of other claims in the vicinity on which work is being done—some with very good prospects but I must defer further notice of them for some future time.

PROSPECTOR.

THE PALMO SILVER MINING COMPANY filed their certificate of incorporation on the 17th. inst. The first Board of Trustees are Edward Tomkins, D. S. Lord, Wm. Faulkner, L. P. Fisher and Joseph Van Doren. Capital Stock, \$240,000 in 2,400 shares. It is located in the municipality of Ryan, Ures District, Sonora, Mexico. This mine of silver petanque metal has the reputation of being one of the richest mines in the State of Sonora. It is in the Sierras de la Palma, near the Aroye de la Palma, where there is a fine water privilege and Hacienda, with twelve arrastas belonging to the mine; also an abundance of wood and pasturage land.

The mine was once worked by the Montezumas and afterwards by the old Jesuits, whose history of the mine, as is seen in their manuscripts or Church records, states that the metal pays 100 marcos per bulto, or 800 ounces of silver to the 900 pounds of ore when worked in the common arrastra or patio process, with the simple use of quicksilver and salt. The mine has always been worked in the primitive style of going to the top of the hills, and sinking, and packing out the ore on the backs of the Peons and leaving Pillars which consists of three fourths of the whole mine. The lower Pillars are in good working order yet, all in metal. The present Company have started a tunnel which will strike the vein below the old works, where they will undoubtedly find the class of metal last obtained from the mine, some thirty years ago, and known as blue petanque or cobre gruisa, the richest class of silver ores.

Nevada and California Processes of Silver and Gold Extraction, by Guido Kustel—Carlton, San Francisco.

It is with considerable satisfaction that we find in this book so much to which we can do inadequate justice this week. The material is treated by a writer who has taken to the mine and the mill a spirit of enquiry which was not to be satisfied without a reply. The result is valuable data for judging of the economy attained, and many suggestions for guidance in carrying on the work of improvement.

The facts in this book will be very valuable to the development of the resources of California. There is one point of importance which is deserving of the earnest attention of trustees of mining companies and mine superintendents. Mr. Kustel writes: "In Germany the roaster works with hands and head, and is responsible for the result. His work can be trusted. Our roasters are inexperienced, frequently, green hands, without the least interest in the result." It may be on this account that he depreciates "precipitation" which has been there so eminently successful. There "common workmen," says a recent writer, "have attained the facility in performing it." The problem is to give them such an interest in the success of the particular operation intrusted to each individual as will ensure persevering application—every step must be checked, then wanton waste, from carelessness, will be prevented.

POLL TAX.—Poll tax it is said must be paid in coin. Greenbacks are not taken by the collectors. The Ophir company at the works in Virginia City, says the *Enterprise*, tendered the amount of poll tax due from their employees to the Collector in greenbacks, and he refused to receive them. The matter will be fully tested. The Tax Collector was about to sue the Ophir Company for each and every receipt. It is said that the refusal of the Collector to receive greenbacks is founded on decisions given in this Territory, in California and some of the Eastern States.

PEN POINTS are now manufactured out of the new metal Aluminium. This metal preferred above any other from the fact that it is not oxydizable.

## THE MINING SHARE MARKET.

The Mining share market, during the past week has been quite active, and notwithstanding the adjournment of the stock Board on Wednesday, a large amount of business has been transacted. The recent disposition on the part of the brokers to call in and curtail their loans on mining securities has had a somewhat depreciating tendency on some of the trading shares, while several speculative stocks have manifested unusual activity and in some instances, an important improvement.

Ophir shares during the past two weeks, have been unusually active, at materially reduced rates. This depreciation is attributable, mainly to an inclination on the part of many first class holders, to let go their shares with the view of other investments. This disposition arises from the anxiety felt with regard to the suit with the Burning Moscow, which is soon to have a hearing.

Gould & Curry sales have been light and fluctuating. The weakness in these shares is attributable to the anticipation of decrease in the next dividend which has been sold, the last week, for \$140 per foot. If the October dividend is lighter than its immediate predecessors, the fact will be owing to extraordinary expenses, for the receipts from the mine this month will be larger than for any previous month since it was opened.

Burning Moscow has been the chief speculative stock of the past two weeks. Although 1300 shares changed hands during the previous week, this stock has continued in undiminished favor during the past week, with sales reaching 919 shares.

Yellow Jacket has advanced \$150 in consequence of a favorable issue of its suite with the Union. Considerable importance is attached to this decision, inasmuch as it is supposed that it will affect, to a greater or less extent several other important suits now pending.

Union, Gold Hill, which has been in considerable demand several weeks, at from \$50 @ 75, suddenly collapsed, the last week, in consequence of losing its suit with the Yellow Jacket and is now quoted at from \$5 @ \$7½.

Uncle Sam, Gold Hill, appears to be coming into high favor. It has suddenly advanced from \$135 @ \$225. Advices from the mine are highly favorable as to the future of this mine.

Sheba shares which have been very quiet of late, has manifested a sudden activity. Opening the week at \$70 they suddenly advanced, near the close, to \$160, but finally declined to \$227½. A few months since these shares were in quest in this market at \$120 to \$500, but for a long time, until within a few days, have been dull at \$75 @ \$100. It has been recently reported that they are now taking out from the mine better ore than ever before, and that the vein is increasing in width. Notwithstanding the "bore metal," which so abounds in the Sheba, and which fact has been met with telling effect by the "bears." We feel warranted in the belief that the Sheba will yet prove a very rich mine. De Soto has advanced to \$40.

Baltic, Gold Hill, has fluctuated from 47½ @ 62, closing \$57.

El Dorado is dull at \$70.

Wide West continues to droop, and is heavy at \$82½, cent assessment of \$25 included.

Utah is a little better, and has sold at \$62.

Real Del Monte sold a few days since at \$470, but is now scarcely so firm. Large amounts of Bullion have been received in this city recently, from this mine.

Rio Grande River Stocks are attracting attention, but so little yet is known of the real value of the numerous claims offered in the market, that operators are somewhat timid in their purchases.

The Florida is held at \$50, 35 bid. Union No. 2 is offered at \$60. Diamond, said to be a promising claim, is offered at \$20. For James River \$13 is bid. Oregon is quoted at \$10 bid, \$45 asked. Flora is enquired for at \$15. 5 is offered for Ontario and \$50 asked. Willow Consolidation is held at \$25. Madison at \$12. Lightner at \$12. Golden Era at \$15. Austria at \$12. Marshall is said to be in much favor, with enquiries at \$40. Mills, Post and White and Erie are enquired for, the former at \$30, the latter at \$25.

## REPORT OF BIDS

At the San Francisco Mining Stock Board.

For the week ending Oct. 17, 1863.

Names of Companies.	Shares per ft.	Par Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.	Latest Asking Price.

je4 A. B. FORBES, Agent.  
Corner of Sacramento and Leidesdorff sts.

FOUNDRIES & MACHINE SHOPS.

**REYNOLDS'**  
Patent Cut-Off and Governor,  
FOR STEAM ENGINES.

127 of these Invaluable Machines,  
ARE NOW IN USE  
In California and Nevada Territory, giving a perfectly  
regular motion and  
Saving 20 to 65 per cent of the Fuel.

**Steen's Improved Governor**

Is the CHEAPEST, SIMPLEST and QUICKEST to set  
and least liable to get out of order of any Governor in  
use. It can be seen in operation at the Golden State Iron  
Works, and at the Stone Breaker, foot of Market Street,  
San Francisco.

**Clark's Steam and Fire Regulator,**

For controlling the Draft or Blast by opening the Clum-  
ney or Valve in the Blast Pipe by the pressure of the  
steam in the boiler. It will regulate the pressure to a  
pound, on the square inch. It CANNOT get out of order  
and any person can put one up in an hour after the dam-  
per is put in.

**Ingersoll's Patent Drill Press,**

With which drilling can be done the same as with the  
common ratchet, and when small holes are wanted, it  
can be done four times as fast. The handle can be work-  
ed in any direction.

**Felt for Steam Boilers, Pipes, Etc.,**

At the lowest market rates.

**Steam Engines, Boilers, Pipes,**

Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest  
market rates.

**Anti Incrustation Powder,**

A Sure Remedy for Scale in Steam Boilers, without injury  
to the iron. In use for the past 25 years.

Refer to—Sugar Refinery, San Francisco,  
Cuttell & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.  
**E. T. STEEN AGENT.**  
No. 33 Fremont Street, San Francisco.

**MOYNIHAN & AITKEN,**

**Boiler Makers and Blacksmiths,**

Mission, between Beal & Fremont Sts,  
San Francisco.

N. B. All kinds of Boiler and Sheet Iron Work exe-  
cuted at the shortest notice, and on the most reasonable  
terms. Jy 29

**PUMPS!**

**HARRISON'S**  
California Lift and Force Pump,

WITHOUT VALVES OR PACKING,  
Suitable for Mines, Fire Engines, Wrecking or Irrigat-  
ing. This is the Cheapest, Lightest and most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

**ALL SIZES;**

Capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute.—For sale by

**C. H. HARRISON,**

PHOENIX OIL WORKS,

Je-15 517 Front Street, San Francisco.

**50 lbs. MARINE and**

**Fire-Proof Paint,**

MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for Hulls and Decks of Vessels  
from ground Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
or Bottoms of Ships, it is equal to a coat of Stone, and  
quite equal to Copper, no worms will ever effect it, and  
cheaper than any other paint.

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur,  
three parts Mineral Paint, mix with Coal Tar and apply  
it hot.

For sale by all Ship Chandlers and Tradesmen, in box  
of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal  
to covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

**DIRECTIONS:**

HOUSE:—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil: if a lighter color is  
wanted, mix less paint, more lead.  
ROOF:—Five parts of Mineral Paint, one part white  
Lead; mix with Linseed oil. Put it thick on a tin Roof  
one coat when properly applied will last three years.  
S. C. BRADSHAW, Agt.,  
G. T. FOTQUE, Superintendent.

**WORKS, North Beach; Office, 599 Sac-  
ramento st., San Francisco.**

FOUNDRIES & MACHINE SHOPS.

**PALMER, HANSCOM & CO.,**

**GOLDEN STATE IRON WORKS,**

No. 19, First Street, San Francisco.

Furnish Castings and Machinery of all kinds

ALSO:

GENUINE WHITE IRON SHOES AND DIES.

PALMER, HANSCOMB & CO.

**To Quartz Miners.**

**Knox's Improved**  
**AMALGAMATING PAN,**  
WITH

**PALMER'S PATENT STEAM CHEST.**

THE ABOVE COMBINATION SECURES THE MOST  
complete amalgamation of the precious metals of  
any process now known.

By it steam is introduced in the most effective and eco-  
nomical manner, while it is peculiarly adapted to the  
catching of floating gold and silver, known to be other-  
wise lost. Made exclusively by

**PALMER, HANSCOM & CO.,**  
GOLDEN STATE IRON WORKS,  
Nos. 19 & 21 First Street, San Francisco

The public are informed that Letters Patent have been  
granted the undersigned upon Steam Chest False Bot-  
toms for the inside of Amalgamating Pans or Tubs, and  
are cautioned against making, buying, using or selling  
the same without his consent. W. A. PALMER.

JOHN P. GALLAGHER.....JOSEPH H. WEED.

**GALLAGHER & WEED,**

AND

**LOCK FACTORY.**

No. 126 First Street, opposite Minna, next door to Pacific  
Foundry, all kinds of

**Brass and Composition Castings and**  
**Finishing, done with neatness and**  
**dispatch.**

**CHURCH and STEAMBOAT BELLS, OF ALL SIZES**  
Made to order. Engine's Gongs made and hung in  
the best manner. Bank, Vault, Store and Prison  
Locks, also brass Bollocks and Ship Locks of various  
patterns, on hand and made to order.

Particular attention given to casting Rudder Bra-  
ces and Ship Work in general.

All Jobs promptly attended to.—Prices  
moderate.

Removed from Oregon street, between Front and Davis.

**Miners' Foundry**

—AND—

**MACHINE WORKS,**

First St., between Howard & Folsom,

SAN FRANCISCO.

**EVERY DESCRIPTION OF IRON AND BRASS MACHI-**  
**nery, the Best and Most Economical, manufactured**  
in the state of California, will be furnished with dis-  
patch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz  
mill machinery, Mining Pumps, Amalgamators, Retorts,  
Etc., Etc., Etc.

Particular attention will be given to the manufacture  
of Machinery in Sections, designed for places of difficult  
access. Various models of Quartz Crushers, Amalgama-  
tors and Water Wheels—some in operation and on exhibi-  
tion.

Parties desiring to test their ores practically, in  
small quantities will be afforded ample facilities, free of  
cost.

All parties desiring accurate and highly finished draw-  
ings and Superior Machinery, at most reasonable rates  
are cordially invited to call before contracting elsewhere

**HOWLAND, ANGEL & KING**  
San Francisco, February 23, 1863.

By a competent person, the Secretaryship of four  
Mining Companies. Books to be kept at the Office of the  
Mining and Scientific Press, No 57 Government House,  
enquire as above. oct6

**SOUTH PARK**

**Quartz Mill and Reduction Works,**

**GOLD AND SILVER ORES WORKED AT REASON-**  
**able rates, and Working Assays made of small**  
**lots. All kinds of ores crushed at short notice.**

**J. H. SMITH & CO,**

Office in Shiel's Block, opposite Masonic Temple.

**S. F. CLOUSER, Secretary.**

**W. W. HANSCOM,**

**Steam and Mechanical Engineer,**

Designs furnished, and Drawings made for  
Engines, Mills, Water Wheels, Mining Ma-  
chinery, etc., etc.,  
**At Golden State Iron Works,**

aug x First Street, San Francisco.

**Eye, Ear and Throat.**

**DR. DE CASTRO,**

**Oculist and Aurist,**

**WHO HAS PRACTISED IN NEW**  
York and all the principal cities of Europe with  
such unrivalled success, and from each place is in pos-  
session of the most eminent testimonials, may now be con-  
sulted upon diseases of these delicate organs, with a view  
to their permanent cure. Deafness of long standing tho-  
roughly cured. The Doctor employs his (by the Medical  
Society of London approved)

**Self-adjusting Artificial Tympanum,**

For the relief of deafness, attended by loss or injury of  
the membrana tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of  
the paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state; the effect of the tympanum was instantane-  
ous—quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets, Entrance on Market street.

**12. Mr. Editor.—Having been afflicted**  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it was with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to re-  
commend Dr. De Castro's skill as an aurist.

**JOHN REESE, Napa Valley.**

James Callaghan, witness.

San Francisco, July 30th, 1863.

[From the Daily Alta.]

San Francisco, June 30th., 1863.

**ED'S DAILY ALTA:**  
Permit me through your widely circulated journal, to  
say that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearney and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly; and is now, I am happy to state in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skillful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.

**CHAS JOHN P. WRIGHT,**

812 Green Street,

## MINING NOTICES.

**Wide West Copper Mining Company, Office, 528 Montgomery Street, San Francisco, September 10, 1863.**—Notice is hereby given that an assessment of Twenty-five cents was this day levied on each and every share of the capital stock of the Wide West Copper Mining Company, and payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, or to J. M. Pike, Superintendent, at Copperopolis.

By order of the Board of Trustees,  
M. G. ELMORE, Secretary.

**Bald Eagle Gold Mining Company, Gold Flat District, Nevada County, Cal.**—Notice is hereby given that an assessment of Twenty-five cents per share has this day, (September 9th, 1863,) been levied by the Board of Trustees on the Assessable Stock of the above named company, and payable immediately in United States Gold Coin to the Secretary at his office, or to T. S. Smith, Superintendent, Grass Valley, Nevada Co.

By order of the Trustees,  
T. L. BIBBINS, Secretary, 105 Montgomery Street.  
sep13lm

**Notice is hereby given that an Assessment of ten (10) cents per share on each and every share of the Capital Stock of the Buena Vista Gold & Silver Mining Company—Fort Pitt Lodge, Prince Royal District, Humboldt County, Nevada Territory—was this day levied, payable immediately in U. S. gold coin, to the Secretary at No 413 Montgomery street, San Francisco.**

By order of the Board of Trustees  
H. B. MINOTT, Secretary.  
September 22, 1863. sep28

**Silver Butte Consolidated Silver Mining Company.**—The regular annual meeting of the Silver Butte Consolidated Silver Mining Company will be held at the office of the Company, No 528 Montgomery street, on FRIDAY EVENING, October 3, 1863, at 7½ P. M., for the election of officers for the ensuing year. A punctual attendance is requested.

By order of the board of Trustees,  
M. G. ELMORE, Secretary.  
San Francisco, September 29, 1863. oct12

**Emmet Copper Mining Company.**—Notice is hereby given that at a meeting of the Board of Trustees of the Emmet Copper Mining Company, held at their office, No 528 Montgomery street, San Francisco, October 1, 1863, an assessment of twenty cents per share was levied upon each and every share of the capital stock of said Company, payable immediately in U. S. gold coin to the Secretary at the office of the Company, or to T. LYONS, Superintendent, Copperopolis.

By order of the Board of Trustees,  
M. G. ELMORE, Secretary.  
oct12

**Dona Carolina Gold and Silver Mining Company.**—Notice is hereby given that at a meeting of the Trustees of the Dona Carolina Gold and Silver Mining Company, held this day, an assessment (No. 2) of fifty cents per share, on each and every share of the capital stock of the company, was levied payable on or before October 1, 1863, in U. S. gold coin, to the Secretary at office of the Company.

The regular annual meeting of the stockholders of the company will be held at their office, MONDAY EVENING, November 1, 1863, at 7½ o'clock.

By order of the Board of Trustees,  
M. G. ELMORE, Secretary.  
San Francisco, September 29, 1863. oct19

**Ruth Windsor Tunnel Company, Esmeralda district.**—Notice is hereby given that an assessment of fifty cents per share was levied on the capital stock of the above company on the 21st day of September, 1863, payable immediately to the Secretary at his office in United States gold coin.

By order of the Trustees,  
T. L. Bibbins, Secretary, 305 Montgomery St.  
San Francisco, October 13, 1863.

## Mining Shares For Sale

BY

O. A. CRANE,

Office 28 Government Block.

- 475 Shares U. S. Mining Company, Virginia City.
- 910 Shares Granada Gold and Silver Mining Company, Virginia Hill, Virginia City.
- 168 Shares Evoca Consolidated Copper Mining Company, Crescent City, Cal.
- 20 Shares Mohave Mining Company, La Paz District, Colorado, N. M.
- 30 Shares Aspinwall Gold and Silver Mining Company, Devil's Gate District, N. T.
- 75 Shares Washington Copper Mining Company, Indian Bar, Tuolumne Co.
- 228 Shares Montezuma Gold and Silver Mining Company, Inyo District, Tulare Co.
- 90 Shares Owen's County Consolidated Gold and Silver Mining Company, Inyo District, Tulare Co.
- 50 Shares Crown Point Ravine Gold and Silver Mining Company, Virginia District, N. T.
- 10 Shares Triunfo Gold and Silver Mining Company, San Antonio District, Lower California.

## AGENTS WANTED.

We want a good Agent in every city, town and settlement, on this Coast. Applicants will send their names with reference, when specimen numbers of the **Mining & Scientific Press** will be forwarded to them, and their names added to our published "List of Agents."

EWER &amp; SMITH.

## PARTNER WANTED.

The Proprietor of one of the oldest and most profitable country newspapers in the State is desirous of taking in a partner. He wants to dispose of one-half of his office to some gentleman well calculated to take charge of the editorial department, as he is a practical printer himself. For further particulars enquire at this office.

## Fire Hose! Fire Hose!! Fire Hose!!!

J. P. D. WILKINS,

The celebrated HARNESSE MAKER of Stockton, makes FIRE HOSE, from the best material, and WARRANTED at a trial of the Weber Steam Engine Co., No 3, of the city of Stockton. This Hose is manufactured at his establishment, and known to stand a pressure of 125 pounds to the square inch; as certified by the Chief Engineer.

## ALSO FOR SALE,

All kinds of HARNESSE and SADDLERY, at the lowest cash prices. REPAIRING done promptly, one door west of the Main Street Stable. oct12

## MINING &amp; SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings of new inventions, prepared expressly for its columns. This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patents with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

## To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers.—Four Dollars per annum;

## Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

EWER & SMITH,  
PROPRIETORS.

VOL. VII. SAN FRANCISCO, MONDAY EVENING, NOVEMBER 2. 1863. NO. 1.

### REMOVAL.

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

### SALT AND SALT MINES.

One of the facts of scientific interest brought to light by the Southern rebellion is the discovery of an important deposit of rock salt of remarkable purity in the island of Petite Anse, in Vermillion Bay, on the Gulf Coast of Louisiana. Salt springs had been known on the island from an early period, but no suspicion existed of there being rock salt near the surface until the late owner, with the view to improve the flow of water from one of the saline springs, caused an excavation to be made, when at the depth of *only fourteen or fifteen feet* from the surface, the laborers struck a bed of white rock salt, which they at first imagined to be ice. There was no moisture or brine in the deposit, the salt being compact, hard and perfectly dry. It was at once recognized, and has since proved of incalculable advantage to the Confederates, as well as a source of great wealth to the owner. The above facts, as condensed from an Eastern exchange, should be a matter of great encouragement to the owners of the "Salt Spring," noticed in our last issue as having recently been discovered in the neighborhood of Virginia City. It was with no little surprise, when conversing with one of the proprietors of this spring, a few days since, that we learned that no efforts have been made to seek for the deposit of rock salt from which this spring, of such intensely salt water, must flow. The locality of the ground and other circumstances are such as to lead to a reasonable supposition that a very slight excavation would, undoubtedly, lead to the most valuable deposit of rock salt ever discovered, and that too, at probably a mere moiety of the expense which would be required for putting up the necessary works for evaporation, etc., which must otherwise be done to render the spring available.

If our memory serves us, it is now several months since this discovery was announced, and yet, as we learn from parties acquainted with the locality, no steps have been taken to turn the same to profit. Perhaps the owners are not aware of the prize they have found. If not, it is to be hoped that some enterprising capitalist may step in and turn to profitable account a discovery, which must soon become of great importance to that region. The consumption of salt in the neighborhood of Virginia City, for domestic and chemical purposes, is already very large and must soon become immense. Its production at so convenient a point ought to bring about a most important reduction in the present price of the article, and by so much, will it become a public benefit to the district, besides a large source of revenue to its fortunate owners, whoever they may be.

### GOLD MINING NEAR PLACERVILLE.

We have several times, during the past season, had occasion to refer to a mining district, known as Poverty Point, a short distance from Placerville, to the north, and on the American River. One of the richest claims in this district, the New El Dorado, has been tied up in law for nearly a year. The case will soon come to trial, however, and the question of title so settled that the work of opening and developing the mine can once more be resumed. The New York Co., who hold an extension of this lead, are now crushing 25 tons of rock per each 24 hours. Their stock is selling in this city at \$150 per share.

The Harmon Gold and Silver Mining Co., which is now almost daily quoted in the stock reports of this city, is also located in this neighborhood. The original locators of this claim were Kenney & Harmon, who have worked the claim constantly with arrastras since 1853. They have recently sold three-quarters of their interest to San Francisco capitalists, who have organized the present Company, and are now putting up a 15-stamp mill, to be run in connection with a set of Eddy's Electrical Amalgamators (using Wheeler's Pans,) the whole to be in operation about the middle of the present month, and to be driven by a 25-horse power engine. They have a 40-foot shaft on their ledge, the rock from which is paying from \$25 @ \$30 in the arrastras. They are also running a tunnel to the vein, through which ore will be taken direct to the mill. Mr. Charles W. Moulthrop is the Superintendent for this Company. This stock first made its appearance in this market, some three or four weeks since at about \$25 per foot. Since that time it has been gradually advancing until to-day we quote it at \$52. They have about 250 tons of good pay rock now on the ground, and will continue to increase their supply of ore until the mill starts. The business office of this Company is at room No 11, Athenaeum Building, in this city.

The Niagara, north extension of the New York, is highly spoken of. They are soon to have 100 tons of rock crushed as a test of the value of their mine. The Dardanelle, west extension, recently took \$1,300 from 10 tons of rock crushed at the Poverty Point Mill. The St. Louis is located in the same neighborhood, also the Quartz Mountain with 600 feet of tunnel and the Massasoit, with 25 tons of rock out and ready for crushing. The Baltic recently made a trial test of their rock with a result of \$22.50 per ton. This is one of the most promising Quartz Mining District, in this State.

THE NEW MECHANIC'S INSTITUTE.—This new building was formally opened to the members on Wednesday evening last. Quite a large number were in attendance. We looked in vain, however, for the presence of many, who should have been there to have given their moral and material aid to an enterprise which promises to be of such vital importance to our city and state. The Library of the Institute is quite large and well selected, and we doubt not that as the long winter evenings approach, this place will be a favorite resort for the mechanics of this city.

A church in Prussia, holding 1000 persons, has been constructed, statues and all, of *paper mache*.

### COPPER IN OREGON.

Dr. Paul d'Heiry, a gentleman well known in this city, has placed in our cabinet several fine samples of copper ore from a lead in Josephine County, Oregon, known as the "Queen of Bronze." One of these specimens consists of the ordinary yellow sulphurets, the other differs materially from any copper ore we have before met with on this coast. It is an antimonial sulphuret of copper, and is found in immense masses, as an outcrop, covering a fine ledge, four feet thick, of sulphurets. The company, which is a private enterprise, under the superintendence of Dr. Heiry, owns, besides the one above described, another, and a parallel ledge, about three hundred feet distant, with a well defined lead of sulphurets, 14 feet thick.

These ledges run due east and west with a perpendicular dip. They are located just above the California State line, and about sixty miles from shipping at Crescent City. The proprietors intend to erect two reverberatory furnaces upon their mine, early the ensuing Spring for the purpose of reducing their ore to regulus. A smelting furnace will subsequently be added in which the regulus will be reduced to ingots, before shipping. The Dr. informs us that an abundance of most excellent material is found upon the spot for making the firebrick which is necessary for such furnaces. There is every indication that the mines must soon become very valuable. The contemplated experiment of smelting the ore at the mine is quite an interesting one at this time, and we shall watch, with much interest, for further result.

THE REFUGIO MINING COMPANY.—The mines of this Company are located in the celebrated Jesus Maria, of the Sierra Madre, in the State of Chihuahua, Mexico, and about 250 miles from the port of Guymas. There is a good wagon road two-thirds of this distance, with a pack trail for the other third. Freight for this city costs about \$100 per ton. A steam engine of sufficient power, with a 20-stamp battery, barrels provisions, tools, etc, went down on the Oregon, on the 15th inst. The mill will be running by February. The entire cost of this "plant" will be \$20,000. The mine will soon be in condition for raising a large amount of ore. The ore is argentiferous, carrying a large value in gold and is very docile in reduction. The Mexican patio process is now in operation at the mine, with a result of about \$125 to the ton. The mine is under the superintendence of Captain Taylor.

MINING EXCHANGE BOARD AT STOCKTON.—A Stockbrokers' Board has been organized at Stockton on a "new principle." Says the *Independent*:

Instead of the *à la voce* bids of Stock Boards, the offers of stock and bids will be accomplished through an ingeniously arranged bulletin board, which will always be lying upon the table in the rooms of the Board, the contents of which will be published every morning in this paper, thereby giving the members wishing to sell, the full benefit of this market.

In the Arctic regions, where the thermometer is below zero, persons can converse at more than a mile distant. Dr. Jamieson asserts that he heard every word of a sermon at the distance of two miles.

## REESE RIVER CORRESPONDENCE.

AUSTIN, OCT. 25, 1863.

EDITOR OF THE PRESS.—Since my last, I have been active in my travels over the mines, and I can see nothing to detract or withdraw from previously expressed opinions; on the contrary I am now more fully convinced of the extent and richness of the mines of this country, than ever. All we want is good practical workmen in our mills. This will take time and experience, for our rock is unlike other ore, and it cannot be expected that men can be found who will at once, under those circumstances, bring out all the metal. We ought not to expect too much. I don't believe in an onslaught which like the whirlwind will sweep down every effort to reach perfection or success. It is the object of mill-owners, and their interest, to do the best within the reach of human efforts, and I doubt not, that in a short time, complaints will be less frequent.

The mills, with one exception, have been running this week and doing good work, though idle the week before. This exception applies to Austin & Duff's Mill. I understand Mr. Austin has sold out his interest in the mill, and bought an interest in a foundry in San Francisco. Report says, he has made his "pile."

The work on the mines is being pushed forward as fast as circumstances will admit.

## BIG CREEK DISTRICT.

There is an excitement about Big Creek District, some 15 miles south of Austin. It has a ten-stamp Mill under completion. The ledges are wide. The district contains a stream of water running on the average, 700 inches of water.

Cañon City, at the mouth of Big Creek Cañon, is growing rapidly, and I might here inform absent owners of city lots that they had better look to their interest by taking actual possession, if they would hold them. Parties have attempted the jumping process in Austin, but not to their entire satisfaction, so they have gone down to Cañon City, where they can play that game to a better advantage. That place, it is universally conceded, is bound to be a place of importance. It is but three miles further from Jacobville, than this place, consequently about as accessible to the western markets as Austin. At Jacobsville on the river and on the overland road, leading to this place, there is a mill in full operation, said to be of the first class. It has been but recently completed, and report speaks favorably of it.

North of Clifton,  $3\frac{1}{2}$  miles, is what is called San Francisco Cañon, where parties have laid out a city, which they call New York. I understand an order has been given for a mill to be erected in the Spring. For convenience this section is called San Francisco Cañon District, to distinguish it from Yankee Blade Section. There are many first class mines there, such as the Lady Adams, Potosi, Scalvonia, Magenta and Muggins. The Lady Adams has an incline over 100 feet. The ledge is but 12 inches wide, and rich in bromides. It stands in good repute. The Scalvonia has a wide ledge, full seven feet and widening rapidly in its descent. I believe it is a good ledge. The Magenta has a tunnel over 35 feet deep, and has a well defined ledge, and I pronounce it of the first class. The Vingaui, still nearer Clifton, is classified with some of the best. I found an incline about 45 feet, ledge 14 inches wide. Pizaro, on the same slope of the mountain is a well defined ledge, presenting the appearance of several veins grouped together; ledge six feet wide; rock hard requiring blasting.

In the hill over beyond the Yankee Blade has been found a ledge called the Oronoco, where almost on the surface is found what is called water-line rock, from the fact that heretofore it has been found only when they strike water, in the shaft, and it is an indication of first class rock. This is what all are desirous to find in sinking a shaft, and it immediately establishes the reputation of the mine. What may be expected on this ledge, when they reach water level, it is fair to presume will be gratifying. The rock resembles the Ontario, and assays \$1690 per ton; ledge six feet wide on the top, and perfectly uniform in quality. The town is growing as if by magic, and the streets crowded with teams and men; presenting for a short distance on Main St., more of a crowded mass of humanity and horse-flesh than on Montgomery Street, in your city.

"Y. I. D."

The use of the ramrod in drilling troops has been dispensed with in England. The reason of this is, the steel ramrod causes the the wear of the rifled barrel by friction.

MOKKUMNE HILL, CALAVERAS COUNTY, }  
OCT. 10TH., 1863. }

MR. EDITOR.—In my last I spoke of our Placer & Quartz Mining, and will now say something of copper, as we have some of that also. And let me tell you that the copper region is not confined to Copperopolis and Campo Seco districts, but is to be found in various portions of our county. There are those who think it is not to be found in paying quantities outside of the above mentioned districts, but they are the veriest Tyros in the knowledge of copper and copper mining.

Some three years ago I predicted the discovery of copper ore east of Bear Mountains and parallel with the Copperopolis lode, also in the San Domingo district. In each of those places, the prediction has been verified.

In the San Domingo district several good claims are now partially opened, and promise, ere long, to be among the best in the county. I will mention now but the following, which are in active operation: the Noble, San Jose, Star, German Hill and Clincher Claims.

The Noble Company has lately erected a steam pumping engine, on their claim, and are now in a fair way of working. Ten thousand dollars have been offered, and refused, for an original interest in this claim.

The German Hill Company has also struck some very fine sulphurets and black oxide, at a depth of thirty feet, in their claim.

The Star Company has struck the same quality of ore as the German Hill, but in greater quantity at the same depth. They have several veins varying from four inches to two feet in width, with good shipping ore as it comes from the shaft.

The Clincher Company is now getting good looking rock at a depth of seventy feet, and as it is located between the Star and German Hill claims, no doubt is entertained of striking the same quality of ore as those claims are now getting.

There are a great number of other claims in this district, (San Domingo,) but those I have mentioned are the principal ones at present, and I propose speaking of one district at a time.

Copper mining, to be profitable, must be conducted by skillful workmen, and I am sorry to see so much neglect, or indifference, manifested by mining companies to this all important fact. I have noticed in a letter from some of your correspondents, statements to the effect that large amounts of money are frequently squandered in useless and unproductive labor upon mines, and that in some cases such mines have received much positive injury from such misapplied work. I could also mention numerous similar cases were it my business to do so. Now why is this the case? Simply because the Directors of Mining Companies are chosen without any thought as to their qualifications for such a position. A body of men qualified for mining directors, will be sure to have a competent man as superintendent, and competent superintendents give value to mines, from their systematic working of the same.

I fear this is already too long, and will close by saying that in my next I will speak of the "dressing" and concentrating of ores; but lest I should differ with your correspondent, J. P., will take time to consider.

AN OLD COPPER MINER.

GOLD MINING IN ENGLAND.—According to the General Summary of Mining Statistics in England for 1862, it appears that only one mine in England made any return of gold for the year 1862. At the present time according to a recent report, there are twenty-four workings named as gold mines. From a report before us of the Directors of the Vigra and Cloggan Mining Co., it appears that the Company are working for both gold and copper. At their gold workings they have introduced Mr. Mosheimer's Amalgamating Pans. Six of these pans are now employed at these works. According to the Report before us, these pans have recently been subjected to a working test with another operation, known as Britten's Machines, in which the Mosheimer Pan entirely outstripped its rival.

THE PIONEER.—The oldest quartz claim and mill in Nevada Territory is the Pioneer, located in Devil's Gate district. It was worked in 1857, first with rockers, and is still worked, paying \$40 per ton of rock, and gradually growing richer in silver. So says the *Enterprise*.

## IMPROVED MATERIAL FOR MACHINE BEARINGS.

Experiments have recently been made upon the London and Northwestern, the London, Chatham and Dover, and other railways, with an improved material for axle bearings. The alloy used consists of iron, copper, tin, and zinc, combined with a small quantity of sulphur, and sometimes also of arsenic. Convenient proportions are—iron, 2 parts; copper, 28 parts; tin, 40 parts; zinc, 130 parts; sulphur,  $1\frac{1}{2}$  parts; and arsenic, 1 part. If the arsenic be omitted, the quantity of sulphur should be increased. The proportions may be considerably varied. In carrying out the invention, it is proposed to take from thirty-two to forty parts of copper; then from two to seven parts of iron; then from fifteen to twenty parts of tin; then from one to two parts of sulphur; and from one-half to one part of arsenic, and mix or combine them together in a crucible, or any other suitable vessel, by first fusing or melting the copper; then add the iron thereto, well mixing them together; then add the sulphur, or the sulphur and arsenic, as the case may be, and again well mix them, afterwards add the tin, stirring the whole well together, and cast into ingots. The inventor does not intend, in all cases, to employ sulphur in the manufacture; for example, in some cases it may be used as a flux to render the amalgamation of the metals or alloys more perfect; in other cases it may be used to render the alloy hard, the quantity of sulphur being varied in the portions above stated, according to circumstances. He also employs the arsenic, either separately or in conjunction with the sulphur, for the same purpose, as above stated, for the use of sulphur varying the proportions. He uses these materials to form the first alloy, or hardening metal, but the above named quantities may be varied, to give this alloy the necessary degree of hardness, according to the purpose for which the improved material or alloy is to be applied. In the second part of his process he takes from eight to sixteen parts of this alloy, or hardening metal, and melts it in a crucible, or other suitable vessel, and when melted, adds thereto from seventy-six to one hundred and two parts of the best spelter or zinc; when that is melted and mixed with the alloy or hardening metal, he adds from twelve to eighteen parts of tin; the whole is then well mixed or combined together, in order to make the improved material or alloy complete; then casts it in the usual manner into the various forms as required. It is proposed to use the alloy as a substitute for gun-metal bearings, and as it can be sold at £84 per ton, Mr. Wm. Levett, the present holder of the patent, anticipates that it will be extensively adopted. From a trial on the London and Northwestern Railway, extending over seven months, during which time a pair of bearings were worked without renewal, it was found that the improved alloy (surfaces equal) lost weight at the rate of  $8\frac{3}{4}$  ozs. per month, whilst the gun-metal bearings, in the same carriage, lost 20 ozs. per month, and the amount of lubrication required with the new alloy was 20 per cent. less than with gun-metal. On the London, Chatham and Dover line, the results of two separate trials, also extending over some time, were even more favorable. Mr. Levett's alloy lost weight at the rate of  $7\frac{3}{4}$  and  $6\frac{1}{2}$  ozs. per month respectively, whilst the loss with gun-metal in the same carriages was  $16\frac{1}{2}$  and 16 ozs. respectively. Experiments are likewise being made upon other railways, the results of which we shall publish as soon as practicable.—*London Mining Journal*.

THE SHEBA.—The following item, from the Humboldt Register, will be interesting in connection with the recent movements in the value of this stock:

"The workmen in the 'Sheba' struck richer mineral, Tuesday night, Oct. 12th., than was ever before found in it. The ledge varies from four to six feet wide, and is beautifully defined and cased. It is supposed by practical men who had an opportunity of judging, that the men took out ore, Tuesday night, to the value of \$20,000. This confirms the statement we made last week—that practical men consider 'Sheba' better worth \$1,000 a foot now than it was ever before worth \$500. Sharpers will be after it, and at the same time undertake to keep it down. When they have once more got it in their own hands, look out for high figures for 'Sheba.' Their recent depression of it, and the reasons they quietly circulated for its going down, did much to injure the whole series of silver mines in this county.

## SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

**HYER & Co.**—The above firm, who advertise with us to-day, are a branch house of the same name at Boston, Mass., who are the largest importers, in their line, in the United States. Having located a branch house in San Francisco, they are determined not to be undersold by any house on this coast. Call at 406 Battery street.

## G. E. MOORE,

Assayer and Analytical Chemist,

No. 612 Sacramento Street,  
HAYING ESTABLISHED A CHEMICAL LABORATORY, and furnished with every requisite for delicate analytical work, is prepared to execute the assay and analysis of ores, Mineral Waters, Guano, etc., with accuracy and dispatch.

## New Style of Ladies' Buckle!

**W. BOHM,**  
INVENTOR AND PATENTEE.

THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the  
construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
possesses several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
It excels all other buckles in

### Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine  
this Buckle at the Jewelry Establishment of  
BRAYMAN & LEVY,  
621 Washington Street, San Francisco.  
JOSEPH, BROTHERS,  
607 Montgomery Street, San Francisco.  
FLOBERG & CONRAD,  
118 1/2 Street, Sacramento.  
Agents for the Patentee.

Every Buckle sold, stamped "W. Bohm," will be  
guaranteed as to its Strength and Durability.  
jy 27 W. BOHM, Patentee.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of area on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most reliable, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
case of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

### METHOD OF CRUSHING ORE.

The BRYAN BATTERY, as now constructed, is believed  
to constitute all the improvements which the experience  
of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their work in 1860, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two  
sizes, four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico.  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill.  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,

## MINING & SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information, concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

### The Inventor!

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patents  
with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

### The Mining Interest!

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Mi-  
ning Stocks, new inventions of Machinery adapted to that  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

### To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of in-  
formation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

### Terms.

To mail subscribers.—Four Dollars per annum

### Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Names can be sent in at different times and from  
different Post-offices. Specimen copies will be sent  
gratis to any part of the country.

### EWER & SMITH, Publishers.

## PEOPLE'S OPPOSITION Steamship Line!

Special Notice.—The  
Line have been withdrawn from the Ni-  
caragua Route until further notice.

### GREAT REDUCTION IN RATES!!!

The Fast and Favorite Double Engine Steamship,

**MOSES TAYLOR,**

J. H. BRETHER,.....COMMANDEE

Will be dispatched for PANAMA

From Mission street Wharf.

FRIDAY, - - - - - NOVEMBER 13, 1863

Punctually at 9 o'clock, A. M., on

Connecting at Aspinwall, by the Panama Railroad, with the  
Splendid Steamship

ILLINOIS - - - - - 2500 Tons.

The Moses Taylor, since her last trip has undergone  
the most extensive repairs. Her decks have been ex-  
tended forward and aft; cabins enlarged, refitted and  
repainted throughout—making her accommodations equal  
to any Steamer on the coast.

For further information or Passage, apply to  
I. K. ROBERTS, Agent,  
No. 407 Washington Street, San Francisco,  
Opposite the Post Office.

## BOOK KEEPING, Penmanship

AND  
COMMERCIAL CALCULATIONS,  
Taught by J. S. LUTY

PRACTICAL ACCOUNTANT,

305 Montgomery Street, Corner of Pine.

### TO QUARTZ MINERS.

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centre and passes under it, between the grinding sur-  
faces, to the circumference: from whence it passes again  
over the muller to the centre, through the holes and be-  
tween the grinding surface to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.  
A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the parties infringing. My Amalga-  
mators can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.  
sep21 THOMAS VARNEY.

## PATRONIZE HOME MANUFACTURIES!!!

### James Longshore,

### Trunk and Valise Manufacturer,

307 Sansome Street, under Tehama House. Trunks and  
Valises, Wholesale and Retail, Fine Sole Leather Trunks,  
Valises, and a fine assortment of LADIES' TRUNKS con-  
stantly on hand. Trunks covered and repaired.

TAY, BROOKS & BACKUS.

THE MINERS' LABORATORY.—NO. XV.  
ASSAY OF SILVER ORES.

*Estimation of Silver contained in Lead Ores.* Many varieties of lead ore contain silver; consequently we will have to describe how to assay an ore of lead first, and then describe the method for obtaining the silver. The common ore of lead is Galena; 200 grs. of the pulverized ore is mixed with 200 grains of carbonate of soda, the mixture placed in an earthen crucible, smeared with black lead; into the mixture is inserted two or three ten-penny nails with their heads downwards; upon this is then placed about 300 grains of salt, and lastly about 200 grains of borax. The crucible and its contents is placed in a small wind furnace—heating very gently, until the whole is melted; then gradually increase the heat and keep at a high heat for about five minutes; remove the crucible from the fire and allow it to cool. Break the crucible, and at the bottom you will obtain a button of lead containing all or nearly all of the silver, together with what gold the ore may contain. The weight of this button, divided by two, will give the percentage of lead. The silver is separated by the process of *cupellation*; an operation founded on the fact that when an alloy of lead and silver is exposed to a current of air, when in a state of fusion, the silver neither gives off perceptible vapors nor becomes sensibly oxidized, whilst the lead rapidly absorbs oxygen and becomes converted into a fusible oxide.

In order therefore to separate the silver that may be present in buttons obtained by assay, as above, it is only necessary to expose them on some suitable porous medium, to such a temperature as will rapidly oxidize the lead. The litharge produced is absorbed by the porous body on which the assay is supported, and nothing but a small button of silver ultimately remains. These supports or cupels are made of bone-ash, slightly moistened with a little water, and consolidated by being pressed into a mould. Cupellation is conducted in a muffle furnace.

As soon as the muffle has become red hot, six or eight cupels that have been drying in the mouth of the opening are introduced by means of a proper tongs and the bottom of the muffle is covered with a thin layer of bone-ash, in order to prevent its being attacked in case of any portion of litharge coming in contact with it during the progress of the subsequent operations. The open end of the muffle is now closed by means of a proper door, and the cupels are thus rapidly heated to the temperature of the muffle itself. When this has been affected the door is removed and into each of the cupels is introduced, by the aid of a slender steel tongs a button of the lead to be assayed. The mouth of the muffle is again closed during a few moments to facilitate the fusion of the alloy, and on its removal each of the cupels will be found to contain a light metallic globule, in which state the assay is said to be uncovered. The lead is now quickly converted into litharge, which is absorbed by the cupel, as fast as it is produced, whilst at the same time there arises a white vapor that fills the muffle, and is gradually carried off by the door and through the openings in the sides and end. When nearly the whole of the lead has been removed, the remaining bead of alloy appears to become agitated by a rapid motion, which seems to make it revolve with great rapidity. At this stage the motion will be observed suddenly to cease, and the button after having for an instant emitted a bright flash of light becomes immovable. This is called the brightening of the assay, and a button of silver now remains on the cupel.

If the cupel was now abruptly removed from the muffle, the metallic globule would be liable to vegetate, by which a portion of the metal may be thrown off, and a certain amount of loss be thereby entailed. To prevent this, the cupel in which the assay has brightened should be immediately covered by another, kept red hot for the purpose. The two are now gradually withdrawn together, and after having sufficiently cooled, the upper cupel is removed, and the globule of silver detached and weighed.

From the fact that silver becomes sensibly volatile at very elevated temperatures it becomes necessary to make cupellations of this metal at the lowest possible heat at which they can be affected. The temperature best fitted for this operation is obtained when the muffle is at a full red heat, and vapors which arise from the assays curl gradually away, and are finally removed by the draught. When the muffle is heated to whiteness, and the vapors rise to the top of the

arch, the heat is too great; and when, on the contrary, the fumes lie over the bottom and the sides of the openings in the muffle begin to darken, either a little more fuel must be added or the draught increased.

If an assay has been properly conducted, the button of silver obtained is round, bright and smooth on its upper surface, and beneath should be crystallized and of a dead white color; it is easily removed from the cupel and readily freed from litharge. The globule is now taken out and flattened on a small steel anvil. The fuel may be either coal or coke, broken into small pieces.

When ores of lead, in addition to silver, contain gold, the button remaining on the cupel is an alloy of those metals. This button is heated with pure nitric acid, when the silver will dissolve leaving the gold undissolved; that is: provided the alloy contains two parts of silver to one of gold; if not, the acid will not attack the silver; should this be the case, the alloy, after weighing, is mixed with silver and cupelled with a small quantity of lead, and the resulting button is heated with nitric acid, the gold collected and weighed, and its weight deducted from the weight of the original button of gold and silver.

THE MONTE DIABLO MINES.

A large amount of work has been done, the past season, in the way of prospecting and developing the mines upon Monte Diablo. In addition to coal, it is now pretty satisfactorily demonstrated that copper, silver and gold exist, and probably in paying quantities, in that region.

During the past week, we have had an interview with Mr. W. P. Green, who has spent the entire Summer among the mines of Mitchell Canon, Clayton District, and who showed us indications and evidences that appear quite conclusive as to the value of the mineral deposits on this famous mountain. We examined among others, the following certificates:—

A working sample from 4,100 pounds of ore sent down from the "Rising Sun Claim," yielded at the rate of \$42 to the ton in silver and gold at Smith & Co's South Park Reduction Works.

The Good Will Co.—Six bags of ore weighing 300 pounds, and taken from the surface, yielded at the rate of \$20.10 to the ton—\$6.70 in gold and \$13.40 in silver.

Quaker City and Little Giant Consolidated—390 pounds worked, with a yield per ton of \$25.60, silver and gold. The rock was all from the surface; only eight days work has been done upon this claim.

The United Claim—Elephant Ledge—206 pounds of surface rock worked with a yield of \$14.60 to the ton. A sufficient amount of work only, has been done on this claim to hold it.

Malachite—Copper—A small lot of ore from this mine, taken to the Antioch Smelting Works, assayed 11 per cent., for which the Company paid \$22.50 per ton. The ore from this mine can be delivered at the smelting works at a cost of \$4 per ton for transportation.

These results speak most encouragingly for the mines of that region. In addition to the companies already enumerated, we would also mention favorably the Garabaldi—copper and silver; Open Sesame, (consolidated,) gold and silver; Great Republic, copper. The Pioneer No. 1, is about shipping ore to this city, the first lot of 20 tons having recently arrived.

The Union, gold, silver and copper, have gone down about 60 feet, at which point they have struck a promising vein of ore. This Company is composed of Copperopolis men, who have become pretty well posted in copper. Some 200 tunnels and shafts have been commenced in this district, which will be prosecuted as fast as assessments can be levied and collected to carry on the work with.

A meeting of miners of this district was recently held, at which resolutions were passed to suspend until the 18th. of April next, the rule heretofore adopted requiring two days work in each month for each 200 feet of ground, in order to hold the same.

A NEW AND NOVEL PUMP.

MR. M. DISNEY, the inventor of a new and novel Pump, has one of his machines in operation at the Golden State Foundry, on First Street, in this city, which all who are interested or curious in such matters are invited to call and examine. The principle and construction of this pump are

such as to admit of its use for a Force and Lift Pump, a Rotary Steam Engine, or a Hydraulic Water Wheel. For the latter purpose its construction appears to be most admirably suited. As a steam engine, we imagine its chief defect will be found in the difficulty with regard to its being properly "packed." We presume, however, that further study and experiment might be able to overcome that objection to a sufficient extent to render it of practical value for even that use. The chief purpose, however, for which the machine has been designed is a pump. The one now on exhibition is of two inch size. It is the intention of the invention to construct them of all sizes, from one capable of throwing 30 gallons per minute, or less, up to 5,000. It is impossible to give any idea of its mechanism without diagrams, Those who would like to know more fully of it are invited to call and examine it as above, or on Third, near Broad Street, in Oakland, where another one of the same make may also be seen in operation. The proprietor is prepared to receive orders for their construction of any size. We understand that several have already been ordered. County and State rights will be sold on reasonable terms.

ESMERALDA MINING CORRESPONDENCE.

Considerable activity has prevailed in the stock market for the past two weeks.

The Del Monte, Pond, Crockett, Western Summit, Lexington, on Last Chance Hill, are all being worked with renewed vigor. About 300 men are engaged on the five claims, working day and night shifts.

The Greenback, Utah, and Cortez, on Silver Hill, are being worked by a large force.

The Cortez Company have sunk a new shaft about 30 yards southerly from the old Indianola shaft and are taking out more silver rock than has ever been taken from the claim.

A new contract has been given on the Greenback Ledge, and the rock increases in richness as the work progresses. Messrs. Lufkin, Lake & Co. have purchased one-half of the entire mine, (400 feet) and are having the rock crushed at their mill. The Company are crushing 45 tons per week. The rock yields on an average \$61 per ton.

The Juniata Tunnel, on Martinez Hill is now in to a depth of 190 feet. The Company are sinking on the Juniata ledge in the tunnel.

The shaft is now down to a depth of about 140 feet. The ledge is over nine feet wide, and the rock increasing in richness.

The Company have about 100 tons of rock out at the mouth of the Tunnel which will be crushed during the coming month at Gregory & Beldens Mill.

The Durant Company have purchased a fine Mill which is now being built on Bodie Creek, below the Autelope and Del Monte Mill. The Machinery has nearly all arrived and the mill will be completed and ready to run by the latter part of December.

The Durant Ledge is situated on Middle Hill, west of the Strawberry Ledge. The rock is very rich, and the Company are again working the claim with a large force. They have several hundred tons of rock taken out ready for crushing, at their own mill when completed.

The Clan Alpine Company are still drifting on the claim. The rock is increasing in richness, and the ledge widening out. The upper shaft is down to a depth of 70 feet, and the ledge is four feet wide.

THE MINING SHARE MARKET.

About the usual amount of business has been transacted the past week, in the Mining Share Market. A larger number of shares than usual have been forced upon the market, which, together with the continued persistence of lenders to call in their loans has exerted an important depreciatory influence upon prices.

Ophir Shares have been unusually active at a large decline. Upwards of 1,000 shares have changed hands during the week. In the matter of its suit against the Burning Moscow, the Company not being ready for trial when the case was called, on Tuesday last, it was dismissed. The Company, however immediately filed papers for a new suit.

Gould & Curry shares, owing to a large falling off of its

dividend—from \$150 to \$100 per foot—has suddenly  
ned from \$4,500 to \$4,350. The receipts of the Com-  
for the past month have been somewhat greater than  
y previous like period, falling very little, if anything,  
t of \$400,000; but the expenditures of the Company in  
prosecution of their new improvements have been un-  
lly large, and will continue so for a month or two to  
a. These improvements will double the working capacity  
the Company's mill. The Board of Trustees have adopt-  
very commendable policy in simply dividing their sur-  
after paying all expenditures as they occur.

urning Moscow still continues the chief speculative stock  
the market, and has fluctuated from \$255 @ 355, closing  
285. There has been a slight falling off in the extent of  
actions in this stock from the two previous weeks.

adison shares have been quite active, and are the only  
we quote at an advance over last week. Their improv-  
is attributable to a consolidation with the Burning  
cow—six feet for one.

iching has been largely dealt in at large fluctuations,  
ning at \$15 they advanced to \$110 on 30 days, but finally  
ed at the original figure.

urnside, after remaining quiet for a long period, has again  
its appearance—390 shares having changed hands  
the week at from \$8 @ \$12.

ncle Sam, after selling at \$250 on 30 days, fell to \$200.  
elation to the late strike in this mine, the Territorial En-  
rise of the 22d ult. says: We mentioned yesterday that  
h strike had been made in the Uncle Sam. Further re-  
s from the mine corroborate all we have said, and make  
ertain that the late developments in that mine are of  
t and permanent value. This is a little further south  
the rich black sulphuret ores of the Comstock range  
ever yet been found. Of course the fact of ores of such  
e having been found in the Uncle Sam creates a great  
ing among those who own feet in claims adjoining and  
ward of the spot where these ores are known to exist.  
holder shares have been but little in demand, and have  
ged hands at a slight depreciation.

orth American has been in considerable demand—455  
es having changed hands at reported rates.

erman opened the week at \$650 on 30 days, but closed  
600.

erra Nevada opened at \$90, declined to \$74, but closed  
00.

verage has declared a dividend of \$50 per foot out of the  
earnings of the month. It is confidently asserted that  
claim can now be considered a permanent dividend pay-  
property.

ultic shares opened at \$57 50, rose to \$64 thirty days,  
closed at \$57 50.

ide of the West, dull at \$30.

dorado, declined to \$58.

orth Potosi is quoted at \$37, and Spanish No. 2 at the  
figure.

t. Davidson, reached \$4, and closed at \$3 50.

orton, has a good market at \$8.

ide West shares have been in considerable demand at  
quotations.

atelope, is quoted at \$175, an advance over last quota-

eba, advanced to \$160 on early sales, and closed at

setters. (See notice of this mine in another column.)

e Soto is dull at \$30.

Excelsior lead, 35 miles east of Aurora, is yielding ex-

nt ore. The Company are about to send two tons to this

for a working test. The lode is from 9 to 12 feet wide.

ys have been made at from \$800 to \$1,600 per ton. Sev-

other companies are being worked in the same district

encouraging prospects.

#### COPPER.

ipments of copper ore still continue to come forward  
the various shipping mines as usual. The ships Invin-  
and Lizzie Moses are now receiving large amounts  
is ore for Boston and New York. The former carries  
principally from the Union and Copper Hill mines, and  
utter from the Napoleon and Newton.

the Union is now shipping about 550 tons per month, of

veraging 20 per cent.

the Keystone is not forwarding any ore at present. The

inery for concentrating is still in course of completion.

the Napoleon has produced for the month of October 360

of ore, varying from 11 to 20 per cent in quality.

## THE WIDE WEST MINE.

Extract from a private letter dated Esmeralda, October 23, 1863.

DEAR FRIEND: I take pleasure in giving you some items about the famous WIDE WEST MINE. By favor of the Superintendent, I have been permitted to go through the works, and I have carefully examined the condition of the mine, which I find as favorable as could be wished. The recent progress of the work reflects the highest credit on the intelligent arrangement of the Trustees and the good and efficient direction of the Superintendent and Engineer. A tunnel has been opened from the mine to the mill, for the transportation of the ore. I look upon this as one of the best mines yet opened in the Territory. The new double ledge is not opened yet, but soon will be, as every previous preparation is now about completed. I think the shareholders will soon hear of important developments and splendid results, which will greatly enhance the price of the stock. I believe the time is near when a thousand dollars per foot will be considered cheap for it. In the meantime capitalists will undoubtedly endeavor to further "bear" the stock; they will tell you there is no water to work the mine and, perhaps, that the mine has given out, but my advice is for you to hold on to your stock. Believe me when I tell you that I think it will be worth \$1,000 per share within four months. Keep it, pay your assessments, and wait with patience for the rainy season.

I am doing, so far, very well myself. I get many orders, have plenty to do, and make more money than I did in San Francisco. I would be glad to see you come over in the spring and spend a few days with me—I could post you about many things which would be useful to you. It is surprising to see the miners getting along so well. My best regards to my friends, especially to George. Tell him I have seen Caroline Meyer. She is earning \$50 per month.

I will write you often, and beg you to let me hear from you as soon as possible.

Yours,

MINING AGENCY.—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented of securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

## Owens River Canal Company.

## FOR SALE,

FOR ACCOUNT OF THE COMPANY, 7,000 SHARES OF the above stock, at \$1 per share. It is confidently presented to the public as the best investment, for the price now offered in this market.

Office of the Company No. 328 Montgomery street.

## New Patent Agency.

WE HAVE CONNECTED WITH THE Publication of the "MINING AND SCIENTIFIC PRESS"

The Patent Agency Business, And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

Mining and Scientific Press Agency The most desirable place to make application for Letters Patent on the Pacific coast. Apply at Office of the "Mining and Scientific Press," Room No. 57, Government House, corner of Washington and Sansome streets, San Francisco. EWER & SMITH.

## FOREIGN PATENTS OBTAINED

By application at this office, Room 57 Government House. EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 57, Government House. Terms moderate. EWER & SMITH.

## PATENT RIGHTS.

Patent Rights Bought and Sold, At the office of the "Mining and Scientific Press" Agency EWER & SMITH.

## IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their inventions illustrated and described in the columns of this paper. Free of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors. EWER & SMITH.

## GENERAL NOTICES.

DR. H. AUSTIN,  
DENTIST,

No. 634 Washington street,

Between Montgomery and Kearny, (over San Francisco Baths.)

I have recently received from London a New and Beautiful Vulcanite (India Rubber) for Artificial Teeth, which is far superior to any other ever used. It is light, clean and durable, and of a natural color. The cheapest and best material for temporary (and in many cases) permanent sets. All operations thoroughly performed, and at reasonable prices. je-29

## DESKS

AND

Office Furniture,  
OF ALL KINDS..... FOR SALE BY

JOHN WIGMORE,

No. 423 CALIFORNIA ST., SAN FRANCISCO.

OFFICE JOBING, of all Kinds, attended to.

## SQUARZA'S PUNCH.

## FIRST PREMIUM

AT THE SACRAMENTO AGRICULTURAL STATE FAIR FOR 1862.

## ALSO; FIRST PREMIUM

At the San Francisco Bay District Agricultural Fair, 1862

MANUFACTORY, WHOLESALE AND RETAIL,

[CORNER OF MERCHANT.]

SAN FRANCISCO.

## WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 7016-1f ZENAS WHEELER.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

Staple and Fancy Dry Goods,

CARPETS, DUCK, ETC.,

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

**REYNOLDS'**  
Patent Cut-Off and Governor,  
FOR STEAM ENGINES.

127 of these Invaluable Machines,  
ARE NOW IN USE  
in California and Nevada Territory, giving a perfectly  
regular motion and  
Saving 20 to 65 per cent of the Fuel.

**Steen's Improved Governor**  
is the CHEAPEST, SIMPLEST and QUICKEST to act  
and least liable to get out of order of any Governor in  
use. It can be seen in operation at the Golden State Iron  
Works, and at the Stone Breaker, foot of Market Street,  
San Francisco.

**Clark's Steam and Fire Regulator,**  
for controlling the Draft or Blast by opening the Chimney  
or Valve in the Blast Pipe by the pressure of the  
steam in the boiler. It will regulate the pressure to a  
pound, on the square inch. It CANNOT get out of order  
and any person can put one up in an hour after the damper  
is put in.

**Ingersoll's Patent Drill Press,**  
with which drilling can be done the same as with the  
common reamer, and when small holes are wanted, it  
can be done four times as fast. The handle can be worked  
in any direction.

**Felt for Steam Boilers, Pipes, Etc.,**  
at the lowest market rates.

**Steam Engines, Boilers, Pipes,**  
Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest  
market rates.

**Anti Incrustation Powder,**  
Sole Remedy for Scale in Steam Boilers, without injur-  
ing the iron. In use for the past thirty years.  
Refer to—Sagor & Son, San Francisco,  
Cutler & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.  
**E. T. STEEN AGENT.**  
No. 33 Fremont Street, San Francisco.

**MOYNIHAN & AITKEN,**  
**Boiler Makers and Blacksmiths,**  
Mission, between Beal & Fremont Sts,  
San Francisco.

**N. B.** All kinds of Boiler and Sheet Iron Work exe-  
cuted at the shortest notice, and on the most reasonable  
terms. Jy 29

**PUMPS!**

**HARRISON'S**  
**California Lift and Force Pump,**  
WITHOUT VALVES OR PACKING,  
Suitable for Mines, Fire Engines, Wrecking or Irrigat-  
ing. This is the Cheapest, Lightest and most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

**ALL SIZES;**  
capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute—For sale by

**C. H. HARRISON,**  
**PHOENIX OIL WORKS,**  
No. 16 617 Front Street, San Francisco.

**50 lbs. MARINE and**  
**Fire-Proof Paint,**

**MANUFACTURED BY THE PACIFIC METALLURGICAL**  
Works in this city, for Hulls and Decks of Vessels  
on ground. Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Deck  
Bottoms of Ships, it is equal to a coat of Stone, and  
its equal to Copper, no worms will ever effect it, and  
easier than any other paint.

**DIRECTIONS:**  
For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur,  
one part Mineral Paint, mix with Coal Tar and apply  
hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes  
50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**  
When used on Roofs, Buildings, or Fences, it is equal  
covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

**DIRECTIONS:**  
HOUSE—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil; if a lighter color is  
wanted, mix less paint, more lead.  
ROOF—Five parts of Mineral Paint, one part white  
lead, mix with Linseed oil. Put it thick on a tin Roof  
one coat when properly applied will last three years.

**Eye, Ear and Throat.**  
**DR. DE CASTRO,**  
**Oculist and Aurist,**

**WHO HAS PRACTISED IN NEW**  
York and all the principal cities of Europe with  
such unrivalled success, and from each place is in pos-  
session of the most eminent testimonials, may now be con-  
sulted upon diseases of these delicate organs, with a view  
to the permanent cure. The tympaanum was instantly  
cured. The Doctor employs his (by the Medical  
Society of London approved)

**Self-adjusting Artificial Tympanum,**  
For the relief of deafness, attended by loss or injury of  
the membrane tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of  
the paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state; the effect of the tympanum was instantane-  
ous—quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

**Mr. Editor—Having been afflicted**  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it is with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to recom-  
mend Dr. De Castro's skill as an aurist.  
**JOHN REESE, Napa Valley.**  
James Callaghan, witness.  
San Francisco, July 30th, 1863.

[From the Daily Alta.]  
San Francisco, June 30th., 1863.

**ED'S DAILY ALTA:**  
Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearny and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly; and is now, I am happy to state in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skillful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.  
**CHAS JOHN P. WRIGHT,**  
812 Green Street.

PROPRIETORS.

VOL. VII. SAN FRANCISCO, MONDAY EVENING, NOVEMBER 9. 1863.

NO. 2.

## AN IMPROVED PUMP.

The pump which we have here illustrated is the invention of Capt. C. H. Harrison, the old Mare Island Pilot, of this city, and is designed to throw large quantities of water, either as a wrecking or mining pump, or for purposes of irrigation. Its principal advantages are that it is light, compact, very durable, and not at all liable to choke or get out of order from any cause. It is self lubricating, and has neither valves nor packing, and operates either as a suction or force pump. It can be run fast or slow, according to the necessities of the case, and the quantity of water discharged is in proportion to its speed. When operating as a mere suction pump, it throws a continuous stream, and is not intermittent, like the common lift pump. It is manufactured of all sizes, from a capacity of throwing 100 to 5,000 gallons per minute.

In the absence of letters upon the above illustrations, it would be quite impossible for us to give anything like an intelligible description of this most valuable invention. Parties desirous of acquainting themselves with the peculiarities and principle of working of this pump, can do so by calling at the place of business of the inventor, at the Phoenix Oil Works, 517 Front street, in this city.

The engraving upon the left represents the working arrangements of the pump, which, as will be perceived, consists of a smaller cylinder working upon an eccentric shaft within a larger stationary one. The motion of the inner cylinder is a rolling and not a *sliding* motion, as is the case with nearly or quite all other pumps in use. It is, in fact, the motion of an eccentric strap; hence the less liability of this than almost any other pump to wear by friction of gravel, when employed for mining and similar purposes. So nicely are all the parts of this pump adjusted, even in those of the lowest calibre, that it might be most effectually used for an *air pump*! The engraving on the right represents the pump as closed up and ready for work.

It is a matter of no little surprise, even to the careful observer, that when such vast improvements have been made and come into general acceptance, in almost every other department of the machinery of mining, the *pump* alone, that most essential appendage of almost every important mine, should remain, down to the present day, almost identical in its construction and mode of application to that employed in the earliest infancy of the steam engine, even when no contrivance had been applied to that machine other than a leverage or balance weight to produce the return stroke of the piston. It is true that numerous appliances have been devised for improving pumps, but none which gave promise of a successful application, on a large scale, for raising water from a great depth; hence we still find the ancient Cornish lift pump at work in mines all over the world.

HARRISON'S ECCENTRIC PUMP.

Ining capacity of the Harrison Pump, we have here just the improvement needed in this particular department of mining machinery. In addition to the qualities enumerated at the outset of this article, we have also a most economical application of power, and an ease and smoothness of working which can never be reached by the most carefully constructed lift pump. There is no jar, not the least irregularity of motion. The inevitable "thug" with which every upward stroke of the lift pump is attended, straining and jarring the machinery in a most damaging manner, is entirely avoided in this pump. The great economy in the reduction of space necessary for its operation, is also quite an important item in many cases.

This pump is not without practice, and we are not obliged to speak of it as a mere experimental machine. One may be seen in operation at the Centerville Salt works, in Alameda county, which has been in constant operation for nearly 12 months as a suction pump, throwing 600 gallons per minute, running at a very slow motion. There is another at work in a mine in Mexico, raising a column of water 200 feet. Another was recently employed in pumping coal and grit from a stranded ship in Bellingham Bay, for three months. The same identical pump, without any repairs whatever, was taken to the late Fair at Sacramento, when it worked quite as well as though it had never been used before. Thousands who saw its performance at that city can unite with us in the fullest testimonial as to its capacity and effectiveness.

A small size 2-inch pump was recently employed for about two months in a gravel pit, at the North Beach Woolen Mills, in this city, with scarcely the least perceptible wear, although constantly discharging sand and gravel, during the entire period, until the work in hand had been completed.

Many of the residents of this city will recollect the employment of one of these pumps (a 4-inch one) some six or eight months since in pumping out the wheat-loaded ship Shawmut, which had knocked a hole in her bottom on one mile rock. The bags of wheat had burst, so that the water was running through the ship.

with the water. The grain proved no impediment whatever to the most perfect working of the pump, although it would have at once choked up and rendered entirely unserviceable any lift pump.

In conclusion we would earnestly call the attention of miners and others to this new pump, which, we can but believe, would prove far more effectual and economical than any other in use for either heavy or light work. Persons desirous of satisfying themselves with regard to the capacity and effectiveness of this pump, will receive every facility for so doing by calling upon Capt. Harrison, the inventor, at 517 Front street, in this city. Capt. H. keeps in constant readiness, as above, a large wrecking pump, capable of discharging from a ship's hold at the rate of 5,000 gallons per minute. He has also a

portable engine fully capable of driving it, both of which can be put in readiness for working and transported to any part of the city or Bay at the shortest notice. He has also smaller pumps for the same purposes.

## THE VIRGINIA SALT SPRING ONCE MORE.

EDITOR MINING PRESS:—In your last issue you expressed considerable surprise that no measures had been taken to turn to profitable account the recent Salt Spring discovery, a short distance north of Virginia City, and intimated that it might be possible the proprietors were not aware of the "value of the prize they had found." Being myself the discoverer of the spring alluded to, and still owning a controlling interest in the same, I would take this opportunity to say that the "proprietors" are fully aware that they have made a valuable discovery, and are anxious to turn the same to "profitable account." Unfortunately, however, we are like most other California prospectors, not blessed with the means to go on and develop the discovery by the erection of suitable works for evaporation, or to provide the transportation required to deliver our salt at even its nearest market. If some of your numerous readers, or some others of the enterprising capitalists of San Francisco, or elsewhere, are disposed to take hold of the enterprise, they will meet with favorable propositions by calling at the New England Hotel, on Sansome street. We are perfectly aware that we have made a discovery quite sufficient to make not only ourselves rich, but any two or three others who may be willing to furnish the necessary capital to start the enterprise.

If, as you intimate, a deposit of mineral salt could be developed, at a small expense, the enterprise would prove still more valuable, in fact, of almost incalculable value; for even if a process of evaporation should be required, the facilities for transportation are so much more favorable than from any other salt locality, that we could lay down the article at Virginia City at just about half the cost at which it can be furnished from any other point.

Please excuse the liberty I have taken in thus addressing you, for publication. Knowing the interest which you take in all matters pertaining to the developments of the mineral resources of the Pacific Coast, I have taken the liberty to ask the publication of this in your valuable journal. My name and address is herewith enclosed. Yours, truly,  
Francisco, Oct. 30th, 1863.  
PROPRIETOR.

### FROM OUR CORRESPONDENT COPPEROPOLIS.

Mr. Editor:—I have just returned from an inspection of the mines of Gopher district which I found more numerous and more important than I expected. Some time ago I received bearing on the mines west of Copperopolis were valuable and the authority of this opinion being considerably relative I could not go down to Gopher district to a certain extent under my impression. Therefore, it is said, will differ—where, I presume have the same privilege; at least I know nothing of the law against our doing so. When, therefore, I say the opinion referred to could only emanate from ignorance or prejudice perhaps both, I say what observation justifies, and every candid man must admit.

Gopher district lies from Copperopolis eight miles on the main branch road, following the plateau, the first place you come to thence on entering the Gopher region. Arriving at Telegraph City the "stage stop for dinner." I do not mean the vehicle takes refreshment, but use the expression as it is generally used in a national, without considering myself responsible for its origin. At Telegraph City then I desire those who have known me thus far in my description of the mines to stop for a short time and accompany me first to the

#### NAPOLÉON.

A short walk say a mile in a southeasterly direction, brings us to the celebrated institution. Everybody, of course, has heard of the Napoleon. It ought now to be called *Napoleon-appeal*, for as it stands developed at this moment the lead in extent and character stands second only to the Union and Keystone—they are marvellous—the Napoleon, magnificent. After taking a phase of notice all will be disappointed superabundant—that is if you use the article—a short time will suffice to inspect the outside works—washing and sorting ore, the engine house, and so forth, all of which so far as they are complete. You then descend below 210 feet to see the "cave" first taking off your coat or boots as the case may require. The descent is by ladder, and if competent, or touched in the wind I assure you it is excellent exercise. The lead as it now presents itself is really magnificent. Depth—for copper eventually cuts out every other mineral—has cleared it of the corruption it carried at first for some distance down leaving the lead now 18 feet wide and pure as a bell. To prove the value of the mine, it is enough to say it has yielded nearly 400 tons of ore this month, 150 tons of which were No. 1; next month it will fully reach, if not exceed 400 tons. Let us take 400 however as its capacity and calculate its value. Making a liberal allowance for all expenses direct and incidental, that yield will give the stockholder a clear profit of \$4,500 per month, or \$75,000 per annum. Yet unprepared to state the stock only runs at about \$5,000 per foot, what is simply ridiculous. For my part in spite of the arbitrary *division* of Montgomery street I hold the Napoleon high amongst its pretensions mine here, from another circumstance it is its position. On shipping ore from Copperopolis the freight is 50 per ton from Telegraph, only \$1. Now allowing the Union and Keystone also to yield and ship 400 tons per month, the Napoleon has the advantage of \$600 per month or \$9,000 per annum, an important item in expenses saved, and one, in my opinion, affording a respective equivalent for the acknowledged superiority of the Copperopolis ore. After witnessing the yield of ore, and the efficiency of the superintendent for a week, personally knowing the prices of freight and calculating the expenses of the entire works, I believe me to be an honest statement of the merits of the mine. If figures do not lie somebody made a great mistake in saying "there was nothing west of Copperopolis worth two straws." If there were in Napoleon, the Massachusetts mine would refuse such modest claims; and I should be waiting in truthfulness and justice to the district and the state were I to allow them to pass unnoticed. The claim consists of 2,700 feet in 15 shares. At present fifty hands are employed, the work being vigorously prosecuted day and night. Taken all in all, our friend Dumas may well be proud of the Napoleon, for the "nephew of my uncle" is not the only one of the name who bears mention.

I have been somewhat lengthy in my account of the Napoleon for two reasons—first on account of its own intrinsic merits; second on account of the relative bearing it has upon the wealth of the entire district. I shall proceed now to the southeasterly side of the same hill, probably a mile, to the

where there is said to be the Napoleon lead about the fixed course of which there is quite a difference of opinion. The first of these is the

#### LOTUS.

As no work was going on in the claim, I am unable to give particulars, further than it contains 4,000 feet, with a shaft sixty feet deep. Next comes the

#### STATE AND EXCELSIOR CONSOLIDATED.

These claims contain 1,200 feet in 8 shares, with main shaft sixty feet deep. No work going on, but I understood the indications were good. Adjoining this claim, running parallel, and quite close, is the

#### CONSTITUTION.

This claim contains 3,000 feet in 14 shares, with main shaft also about sixty feet. No work was going on in the claim, a circumstance I regret, as it prevented my forming an opinion as to their being on the Napoleon lead. The owners, I understand, are satisfied with their prospect. The rock certainly seemed favorable. The dip of these two claims is towards each other. From this, it is evident, both must be on the lead and they are so close that the younger claim will lose its honor whichever strikes the lead. I think it would be wise policy for them also to consolidate. The first in this direction is the

#### CAMP & MCNUITY.

This claim contains 1,500 feet in one foot shares; main shaft sixty feet deep. There has been much more work done here than on any of the preceding. A year ago it was quite celebrated for the mass of magnificent carbonates found near the surface some of which were exceedingly rich in gold. Mr. McNulty showed me the only four containing gold he had left; they were very handsome. These carbonates, of course, soon gave out in the case, as in many others without leading to an extended lead, and so the shaft still goes down, and I think they will have to go deeper than they expect. The principal interest attached to these claims, is the question whether or not they are on the Napoleon lead. I think it much could be said in favor of the affirmative side, and but little against it. Turning right round here, and traveling about a mile northeast, I found the

#### COLLIER.

It contains 2,200 feet in nine shares, with two shafts, one fifty feet the other eighty-five. This claim is doubly important just now, from the fact of its being considered on the Napoleon lead, and the only one in the district, besides that main shipping ore. If the character of rock is any indication, it cannot belong to the Napoleon. It is very peculiar, carrying more black oxide than I ever saw before. It ought to go from 15 to 20 per cent, averaging perhaps 18; the yellow ore reaches 25. The lead is established and settled, but not at present very large. I believe this lead, although half a mile from the Napoleon, is a separate lead, running parallel and north of the former, and will be found next to the

#### LOCKINAR.

This claim contains 2,500 feet in 27 shares; shaft about 45 feet deep. You must understand we have now come back to a few minutes walk to Telegraph City, steering north and leaving the Napoleon and Collier behind us. If the Collier is a distinct parallel lead, the Lockinav will strike it, not under 100 feet deep; the chances are it will be considerably over that. The rock looks well, it carrying considerable black oxide, copper pyrites, and yellow sulphurets. Were I a stockholder in any of these claims, I should watch the progress of the Lockinav with much interest for success here ensures success to McNulty and those adjoining him. Going still northeast, about another mile, we come to the

#### LIVE OAK.

Work in this claim is suspended on account of water, which is somewhat rare in this district; the claim, however, has a good reputation. It contains 1,200 feet in 12 shares; main shaft 60 feet deep. The rock carries an immense body of muck, and it is generally supposed it 20 or 30 feet more were added to the shaft, instead of drifting, a good vein would have been struck. Impatience to strike some thing sooner than nature allows has been a common evil here. In copper mining as a general rule three things are essential to success—first, depth; second, depth; third, depth. One deep shaft is worth twenty shallow ones. After spending any amount of money in foolish labor here they have found this truth out, and all now go in for depth. Thus more de-

velopments will be made next year of advantage to the community that during the last three years. In the same line bearing north, perhaps quarter of a mile, is the

#### TECUMSEH.

This claim contains 3,000 feet in 30 shares, with main shaft 100 feet deep. Mr. Batchelor is the superintendent of this mine as well as the Collier. I observe Mr. B. keeps his claims in admirable order and does excellent work. This is an established vein with every requisite; but some 20 or 30 feet more have to be added to the shaft before it is thoroughly opened. The Tecumseh is the last on the vein I have followed from the Collier, before it is supposed to dip into the Napoleon or main lead at the Hughes' claim on Quail Hill, a mile and a half hence, northwest; but before I speak of it I must mention the

#### TEXAS.

It contains 3,900 feet in single foot shares, with shaft 80 feet deep. This claim is about one mile or less from the Tecumseh, northeast, and in an isolated location on what is supposed to be another vein. The rock is of good character, carrying strong yellow sulphurets all the way down. Although evidences of a vein exist at the bottom, I could see no indications of luck. With them it is entirely a question of depth, a stout heart and a stout arm. We now turn in a northwesterly direction, and come to the

#### HUGHES' CLAIM.

This contains 1,800 feet in 12 shares. It is, perhaps, the most remarkable claim in the district. All the surface down to a considerable depth is good to crush for gold, some of it to sluice. It has assayed \$65 gold and silver to the ton. When first opened they also struck an immense deposit of carbonates, out of which they shipped 270 tons, averaging from 20 to 24 per cent. These, of course, gave out, and now they have commenced a new and permanent shaft which is to be continued until they strike the lead. Considerable labor has been done here, but not lately owing to a misunderstanding amongst the proprietors. The Hughes' claim has a high local reputation. On the other side of the hill are the

#### CONSTITUTION AND BUCKEYE.

The former contains 2,700 feet in 15 shares, with shaft 60 feet. The dimensions of the latter I did not obtain. I confess I am at a loss to say what vein those claims are on. The rock is good, carrying excellent sulphurets all the way, and in character strongly resembling the Texas. The Buckeye looks particularly well. It is, however, useless to speculate on their connection, for it is one of those contradictions sometimes occurring in mining, which time and labor can only explain and reconcile. Continuing onwards in about a northeasterly course for another mile or so, we come to the last in this direction—

#### THE NEW YORK.

This claim contains 3,000 feet in 1,200 shares. From Telegraph city it is due north three miles. The main shaft is 112 feet. It is developing itself in a splendid manner, promising to be a second Napoleon, to which the rock bears a remarkable resemblance. I have a very high opinion of this mine. I think a few weeks will make quite a discovery. I had here the pleasure of meeting an old friend whom I had not seen for three years, who is largely interested in the New York. I sincerely congratulate him upon his good fortune.

#### THE JOSEPHINE.

I have reserved the account of this mine until last, because adjoining the Napoleon on the west side, it would have confused my account from the direction I took to have introduced it sooner. The claim contains 1,300 feet in eight shares. The old shaft, 150 feet deep, is abandoned and a new one commenced. It is, of course, on the Napoleon lead, which there seems no doubt of striking in the new shaft, over which a good shed has been built. It is worked day and night.

This closes the account of Gopher district. You can now judge whether "there is nothing west of Copperopolis worth two straws." Before I close I must again express my thanks to the Napoleon people for renewed attentions; to Mr. Laughlin and Mr. Bowen for many civilities; to the superintendents generally for the liberal patronage they have extended to our paper. I trust under your able management they will find it ever faithful to the great interests of the State, and to the rights and privileges of the intelligent and industrious miner.

L. H.

October 27th, 1863.

As a PROOF of the correctness of our traveling agent's judgment, we understand Messrs. Rhemme, Herine & Co. have within a day or two assayed a small portion of the Massachusetts' rock, Copperopolis, Calaveras county, and it yielded \$3 12 in silver, and 17 1/4 per cent. in copper. The shaft is only down 30 feet. Our agent's prediction that another Union had been struck seems verified.

**G. E. MOORE,**  
Assayer and Analytical Chemist,  
No. 619 Sacramento Street.

HAVING ESTABLISHED A CHEMICAL LABORATORY, furnished with every requisite for delicate analytical work, is prepared to execute the Assay and Analysis of Ores, Mineral Waters, Guanos, etc., with accuracy and dispatch.

**New Style of Ladies' Buckle!**

**W. BOHM,**  
INVENTOR AND PATENTEE.

THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the  
construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
possesses several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
It excels all other buckles in

**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine  
this Buckle at the Jewelry Establishment of

Agents for the Patent.

Every Buckle sold, stamped "W. Bohm," will be  
guaranteed as to its Strength and Durability.  
W. BOHM, Patent Att.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most effective, Economical and Durable Character. It may  
be safely said that Millions of Dollars have already  
been expended upon this vast enterprise in this dis-  
trict of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

#### ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

#### METHOD OF CRUSHING ORE.

The BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

#### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

#### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ties. They are adapted to

#### BOTH WET AND DRY CRUSHING.

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent. more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1860, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co. Esmeralda,  
Crown Point Co., Gold Hill.  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,  
San Carlos Mining Co., Owen's River,

Fremont street.

## MINING & SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES

A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

#### The Inventor!

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with fac-  
ilities at Washington that enable them to obtain Patents  
with dispatch.

#### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of reading matter pertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

#### The Mining Interest!

Will find it of great value, as it will contain all the  
news pertaining to Mining, the prices and sales of Min-  
ing Stocks, new inventions of Machinery adapted to that  
purpose, and of every thing generally that may be of ser-  
vice to the Miner.

#### To Chemists, Architects and Millwrights.

This Journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of infor-  
mation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Chan-  
cellors will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

#### Terms.

To mail subscribers:—Four Dollars per annum.]

#### Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$10.  
Ten Copies for Twelve Months, \$30.

Names can be sent in at different times and from  
different Post-offices. Specimen copies will be sent  
gratis to any part of the country.

**PRACTICAL ACCOUNTANT.**

305 Montgomery Street, Corner of Pine.

#### TO QUARTZ MINERS.

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything heretofore known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centre and passes under it, between the grinding sur-  
faces, to the circumference; from whence it passes again  
over the muller to the centre, through the holes and be-  
tween the grinding surfaces to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the parties infringing. My Amalga-  
mators can be seen running at Donahue's Foundry, where  
all can judge of their quality and the very superior  
style in which they are being manufactured.  
sep21 THOMAS VARNEY.

## BUBBLE MINING AND HOW TO AVOID IT.

The recent developments concerning the Santiago, Daney, and several other mines of lesser note, are teaching a lesson which will not be without profit to all reflecting people engaged in mining enterprises of any character. These developments could not have occurred more *opportune*. That they will be productive of beneficial results we fully believe, and it is a matter of no small congratulation that the cost of the lesson has fallen chiefly upon shoulders abundantly broad to bear the burthen.

It may be that legitimate enterprise will suffer to a great extent in consequence; but it should be borne in mind, that had further delay have been made, the consequences would have been far more wide spread and ruinous. Not a doubt can be entertained that numerous similar speculations have for a long time been in process of "cooking," and these timely developments will undoubtedly have the effect to nip many an "operation" in its incipency, and for a time, at least, prevent the attempting of any new schemes of similar character.

Such are the present facilities for the formation of joint-stock companies, and so great has been, of late, the desire for this class of investment, that it is scarcely possible that the two or three bubbles which have already burst can be all that have been swimming in emptiness upon the ocean of speculation with which we are surrounded. Our faith in human nature is too weak to discredit the idea that we have not in our midst yet other unscrupulous adventurers, who have been taking advantage of these favoring circumstances to devise schemes for filling their own pockets at the expense of others. When we consider how simple the process and how considerable the object to be gained, we need not wonder that, among California operators, men are found ready and willing to embark in such promising enterprises.

The first step in a scheme of this kind is to select a vein where at least a small quantity of gold, silver or copper can be obtained, and if near a prosperous concern all the better.

Two or three flaming reports of surface indications, or early developments, are then spread abroad through the newspapers, after which a "Company" is organized. A secretary is now obtained, who, with the promise of a permanent appointment and a liberal *bonus*, is willing to be made a tool in the villainous scheme. A majority of the directors are either lured into it by paid up shares or liberal fees, or they are selected for the facility with which they may be controlled by the schemers. A superintendent is next sought out, who will be swift to do the bidding of his employers. Now follows the farce of a development. An "incline," perhaps, is commenced, and extended downward a hundred feet or so; a small quantity of ore is taken out, and *saltd*, perhaps with gold or silver, or perchance with rich ore *bought* or *stolen* from another mine. The ore thus "cooked" is taken to some mill of established reputation, crushed, and a certificate of the extraordinary yield taken for publication and for private circulation. If the scheme is a large one, this operation is repeated two or three times. Its cost is comparatively nothing, as the proceeds go back into the hands of the schemers. The stock is now put into the market, the "extraordinary" results advertised and editorialised in all the leading dailies; shares are eagerly sought for and reported in great demand, as they really are. Everything looks fair and promising. Even an expert, who may be permitted to visit the mine, if not especially on his guard, will be deceived by the plausible reports from the mill into really believing that the worthless rock before him is a valuable ore. This may all the more readily occur from the fact that but very little difference can ordinarily be seen by even the practiced eye, between rock that will barely pay the expense of crushing, and that which will pay a handsome profit over both milling and mining. Under the excitement the projectors sell out to their dupes, and the swindle is accomplished ere the first dishonest act is detected.

But, it will be asked, how are the public to distinguish between a legitimate and profitable enterprise and one of these swindling schemes. First, no man should invest a dollar in any mining enterprise until he has previously ascertained that the directors and superintendents are men of acknowledged standing for honesty and probity. While it is admitted that mining enterprise, in this State, may have attracted more than its average of unreliable or absolutely dishonest men, it is not right, or at all warrantable, to assert that capitalists who are willing or desirous to invest in such operations, can-

not find a fair amount of honest operators, even in this branch of business, with whom to entrust their ventures. Mining directors, superintendents and secretaries, should be men of high character, who should be considered responsible to society, if not to the courts, for the correctness of their reports and the rectitude of their action in their respective spheres. Legitimate mining enterprises will never succeed, in this or any other country, except under such management. Let men of means refuse to invest a dollar in any enterprise that is not in the hands of managers who have a standing in the community. Such a course will do more than anything else to expose and keep down the hollow and worthless schemes which, under other circumstances, will always be concocted to delude the incautious or inexperienced.

It is dangerous to the community, and disastrous to the business, to countenance in such positions men who have proven themselves dishonest or who are recognized only as shrewd schemers. Whoever buys mining stock controlled by such men, may calculate the chances as more than even that they will be in some way "roped in" or "swindled." We fully endorse the advice of an evening cotemporary who remarks that "suspicious characters must be expelled from the directory of all mines that expect to gain legitimate standing. No man should put money in any mine unless he has good reason to know that the management is in honest and competent hands. Above all, no one should risk all he has in any mining enterprise, for at best it is very much of a lottery."

The idea is not a bad one which has recently been broached in the city of London, to counteract the very evil of which we are writing, and which has recently assumed quite an importance even in that old established headquarters of English mining. Several leading mining men are there moving in the matter of the organization of an association, which shall act as a medium of communication between men who are seeking mining investments, and through which any man desiring to invest may ascertain the character and standing of the men who control the various companies; the society to have its headquarters at London, with branches throughout all the mining localities. Much good is predicted from the influence and working of such an organization. We are not yet fully advised of the details of the plan. Should anything definite be arrived at we shall lay it before our readers.

## ANOTHER HUMBUG EXPOSED!

The San Francisco (Colorado) Placer Mines a Myth.

By the Brother Jonathan, which reached this port on Friday week, arrived several persons returning from the new San Francisco diggings—so called—about the extraordinary richness of which so much has been said of late. We have obtained the information, which we subjoin, from Mr. Robert Hamilton, of this city, a gentleman of the most unimpeachable veracity. Mr. H. spent two weeks in the diggings, visiting both the Walker's and Weaver's diggings, conversing with great numbers of miners, or rather, prospectors, for there is no mining, worth the name, going on there. He and his partner, in the course of their prospecting, sunk at least 25 holes to the bed rock, and, in no one instance, found anything more than the mere color; nothing which indicated anything more than fair sluice diggings, when plenty of water could be had at a reasonable price. He returned from the diggings, as far as Le Pas, with twelve others, all experienced prospectors from Boise River, each of whom agrees with himself in pronouncing the mines the most unmitigated humbug which has ever been started in California! Several of the company had been in the mines since last July, and all the gold brought away by the entire party belonged to one man, and consisted of a nugget worth about \$2 50 which was taken, by him, from a claim belonging to a company, one of the members of which was a friend of his. This man spent some two days on the claim, and was allowed to crevice on his own account, which he did. All he obtained for this labor was the \$2 50 nugget. This is the only claim in all that region which has yet been found to pay expenses to a white man! Mr. Hamilton has given us a full and as particular a description of the mines and the route thither as could be obtained in so brief a time—two weeks—which he thinks is quite sufficient to learn all that will ever be profitable to any one of that country. He spent the first week in October in and about the Weaver's diggings, and the subsequent week in Walker's diggings, about forty-five miles distant. The entire ground comprised by the former is a small gulch, some two or three miles long by a

few rods in width. This gulch is occupied exclusively by Mexicans, from 400 to 500 in number. The only person of any other nationality among them was a blacksmith, who supported himself by plying his trade at sharpening picks. The bed of this gulch is covered with boulders, among which is a little gravel. It requires three men constantly at work to get gravel enough for one man to pan out! All the water for panning was obtained by sinking holes to the bed rock. There is not a single rocker at work in either Walker or Weaver's diggings, nor was there water enough in either place to work one while he was there—nor had there been since the diggings were discovered, so far as he could learn.

He saw a large number of rockers in the possession of miners along Antelope Creek, packed there with the expectation of using them, but he never saw one which had ever been put together for use! The only place where it would have been possible to work a rocker at all was where the trail first strikes Antelope Creek, and where, within the space of less than half a mile, some twenty Mexicans were at work with pans—barely paying expenses. The prospects were so poor that no Californian, after prospecting, ever thought of stopping there. At this point was nearly all the water, except that obtained by digging, which was to be found in the entire region for fifty miles around. There was so little here, that the twenty Mexicans at work with pans rendered it so muddy that it was with difficulty the mules could be forced to drink from it!

From this point for about forty-five miles up the dry bed of Antelope Creek, and the gulches emptying into it, from the hills on either side, our informant and his partner prospected, and met numerous other prospecting parties, not one of whom had ever found a place which they considered of sufficient value to locate and wait for the rains, even if they had been sure of their coming within a few weeks.

At the northern extremity of this forty-five miles of dry creek bed, is a sort of ravine or gulch, where the creek—when it is a creek—appears to have its rise. This ravine is some five or six miles long, with an average of a few rods in width. Along this ravine were scattered a few claims which had been prospected and were thought of sufficient value to locate. The owners were among the first comers, and each claim had some person stopping upon it and holding it for the benefit of the company, the most of whom were out in the mountains prospecting. Only one claim of the entire number was being worked, and that by two men with a pan! Our informant said he did not know what it was paying, but considered it doubtful if they were any more than making expenses. In the course of his prospecting, he found several places which he thought might pay with a sluice and good head of water. The prospect of water there was considered very doubtful by all. Nothing definite could be obtained with regard to the rains from any person. The general impression was that some time during the winter they would get a little rain, but probably not more than enough to work much except while it was raining. Neither the general features of the country or the bed of the creek presented indications of anything more. Our informant pronounces the reports of dry digging by crevicing, blowing, winnowing, etc., of which we have heard so much, without any foundation, whatever, except in one solitary instance.

Just at the lower point of the mountain range which separates Walker's from Weaver's diggings, and a mile or two from where the trail strikes the Antelope Creek, as already described, are two claims, each comprising about one-half of an acre of ground. These claims are located on the top of the hill or mountain some 300 feet above the bed of the creek. One of them hardly pays "grub." From the other there has undoubtedly been a large amount of gold taken; all coarse gold, in pieces, none less than two-bits in value, and from that up to \$150. Our informant has seen one worth about the latter sum, and numerous others from one dollar in value up to \$100. This claim, which is worked by crevicing, was taken up by two Frenchmen. Its value soon became known, and the report that the Frenchmen carried a large amount of gold about their persons tempted a couple of Mexicans to attempt a robbery. One of the partners was attacked and mortally wounded. He killed one of his assailants as he lay upon the ground in his death agony; the other fled without getting any of the treasure. The surviving partner soon after sold out the claim for five hundred dollars—there appears to be no doubt about the amount—took an escort of twelve men, and started with his own

and his partner's gold for Le Pas. Our informant met the party about half way on their road as he was going to the mines. Report says he took with him 100 pounds of gold. Our informant don't believe any such thing. He probably took a large amount, however. The claim was, undoubtedly, pretty well worked out before he sold.

How the gold was deposited in this claim is a mystery to all who have examined the locality. It is smooth and water-worn, and a long distance from the creek. Not the color of gold is found for more than a mile around, except on this one little place on the top of that hill.

The entire region for 100 miles is being thoroughly prospected, but, at the time of our informant's leaving, without resulting in finding anything of value. This last grand humbug has doubtless been gotten up for speculative purposes, by a few copper mine owners near Le Pas to attract workmen to that locality, and a ferryman or two on the Colorado. The affair has since been stimulated and the cheat kept up mainly by a few Jew traders at La Pas, who had been induced by the first reports to take goods to that locality. The San Francisco mines may be set down as a most arrant swindle.

#### MEXICO—HER TRADE AND MINES.

The rapidly increasing trade between this city and the various ports on the gulf of California, has induced the steamship owners, Messrs. Holladay & Co., to place the Steamer Panama in the line, and we shall now have regular departures of steamers semi-monthly, for the ports of Mazatlan, La Pas, and Guaymas. The Steamer Panama cleared for these ports on Thursday last, with a full freight of passengers and merchandise, including large quantities of machinery, tools, etc., for the various silver mines now being energetically worked in Lower California and Sonora. Among the passengers were many miners from the Washoe and Esmeralda districts, who having made a prospecting trip to the Mexican mines, are now returning with a conviction that a field for labor and profit is opened in that section of country far surpassing anything offered in more northern latitudes. The inducements held out by the Mexican Government for the enlistment of American enterprise in the matter of working the mines of that country are certainly very great, especially as so many well known and exceedingly rich mines, partially opened, but abandoned for the want of necessary capital to work the same, are to be obtained by a compliance with the Mexican mining laws, which are very liberal in this matter. Others of equal value, and being worked by the rude and primitive style of Mexicans, are to be obtained by a fair and equitable arrangement with the owners thereof, who are very ready to dispose of their mines to American companies, providing the necessary capital is employed in the development and working thereof.

The port of La Pas, Lower California, is open for the shipment of ores free, and all mining tools and machinery are admitted free of duty. Miners are not taxed, and the influx of Americans is hailed with delight. The climate is not excelled in any other part of the world; the weather in Lower California, especially, never being either too cool or too hot.

A large number of mines in Lower California and Sonora are now being successfully worked by San Francisco companies, among which may be mentioned the "Pena," "Trunfo," "La Marroñena," "San Antonio," "Gobernadora," "Ophir," "Codicila," and others on the Peninsula; and the "Palma" and others in Sonora. The Palma mine has more recently been taken possession of by its present owners, but from indications presented by the large shipment of tools, etc., on the Steamer Panama, we are led to believe that the company intend to work the mine, which has a very favorable history, with the greatest vigor. The "Triunfo" Company, we learn, have nearly completed their mill, at an expenditure of some forty thousand dollars. The "Marroñena" Company have out a large amount of rich ore, which they intend shipping to England early in the coming season. Several of the other companies, we are informed, also intend shipping their ore to England as being the most judicious move at present, the transportation to ship being only 18 miles from the mines. The "Palma" Company (Sonora) will erect works near their mine, which can be done at comparatively small expense, as they have an abundance of water power near by.

From information which we have gained relative to the mining interest in Mexico, we are induced to form the most favorable opinions. The fact is indisputable that Mexico is a silver bearing country—that Government titles are given to no mines in that country, except on information satisfactory to the Government that the mines are good. When a title is obtained by regular denouncement or purchase, it can be relied on as safe and secure, being protected by the Government. No revolutions in Mexico ever have or ever will effect the mining interest, so long as that interest is confined to its own legitimate channel; and private titles obtained from the

Government will be equally respected by any power which, perchance, may in the future have possession there.

We have not time to enlarge on the subject of the mining interest in Mexico in this number, but will, in some future number, have more to say on this great and growing subject.

#### THE MINING SHARE MARKET.

The mining share market has been much excited during the week by exciting reports with regard to the management, or rather mismanagement, of the officers of two or three corporations; notwithstanding which, about the usual amount of business has been transacted.

Ophir have been the chief speculative shares. They commenced the week at \$1,425, and gradually declined to \$1,150, seller 30 days, on the announcement of a dividend of \$24 instead of 48 per foot. Near the close of the week, a telegraphic dispatch was received of a rich discovery in the northern portion of the mine, upon the strength of which the stock was carried up to \$1,650 on 30 days, but finally closed at \$1,475, with a weak market. The sales for the week reached the number of 1482 shares, a larger business in this stock than ever before reported for the same period.

Burning Moscow continues much in favor with speculators. The shares advanced materially on receipt of intelligence of an injunction against the Ophir, but receded to about previous figures on advices that an application to modify the injunction had been refused.

No other especial features have been observable in the market during the week. We refer to our report of stock bids and sales.

#### REPORT OF BIDS

At the San Francisco Mining Stock Board,

For the week ending Nov. 7, 1863.

**DISCOVERY OF A SILVER MINE ON LAKE SUPERIOR.**—I here is considerable excitement at the East connected with the Lake Superior trade, in consequence of the discovery of an immense deposit of silver bearing lead in that region. Marquette county is the locality of this new discovery. It is stated that the ore yields 20 per cent. of pure lead, and that every ton of lead yields 25 pounds of silver, worth \$300, besides the value of the lead. Operations will be commenced ere long for "removing the deposits."

**CHEAP POSTAGE.**—As might be expected, the establishing of a uniform rate of letter postage throughout the United States has had the effect to greatly augment correspondence between the Atlantic and Pacific States. For example, says the *Alta*, there has been an increase of 25,000 letters via the Overland Mail route since the new law went into effect on the 1st day of July last.

The largest water wheel in the world is about five miles from Douglass, on the Isle of Man. Its diameter is 72 feet, width 5 feet, has 168 buckets 19 inches deep, each holding 9 gallons. It exerts the power of 120 horses, and raises water and coal 484 yards. The axle-centre and crank weighs 33 tons, and the wheel performs four revolutions per minute with the buckets but half filled. It takes two quarts of oil per day to keep it running smoothly. The cost of the wheel was £3,000 or nearly \$15,000.

**AN EAGLE'S FLIGHT.**—It has been ascertained by a traveler in the Grisons, Switzerland, than an eagle flew in his sight five miles in five minutes.

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented of securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

### Owens River Canal Company.

#### FOR SALE,

FOR ACCOUNT OF THE COMPANY, 7,000 SHARES OF the above stock, at \$1 per share. It is confidently presented to the public as the best investment, for the price, now offered in this market.

### New Patent Agency.

**WE HAVE CONNECTED WITH THE** Publication of the "Mining and Scientific Press"

**The Patent Agency Business,** and would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

**Mining and Scientific Press Agency** The most desirable place to make application for Letters Patent on the Pacific coast. Apply at Office of the "Mining and Scientific Press," Room No. 57, Government House, corner of Washington and Sansome streets, San Francisco. **EWER & SMITH.**

**FOREIGN PATENTS OBTAINED** By application at this office, Room 57 Government House. **EWER & SMITH, Solicitors.**

### NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 57, Government House. Terms moderate. **EWER & SMITH.**

### PATENT RIGHTS.

**Patent Rights Bought and Sold,** At the office of the "Mining and Scientific Press" Agency **EWER & SMITH.**

### IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described in the columns of this paper. For charge, they merely furnish the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors. **EWER & SMITH.**

### GENERAL NOTICES.

### DR. H. AUSTIN, DENTIST,

No. 634 Washington street,

Between Montgomery and Kearny, (over San Francisco Baths.)

I have recently received from London a New and Beautiful Vulcanite (India Rubber) for Artificial Teeth, which is far superior to any other ever used. It is light, clean and durable, and of a natural color. The cheapest and best material for temporary (and in many cases) permanent sets. All operations thoroughly performed, and at reasonable prices. **JE-29**

### DESKS

SAN FRANCISCO.

### WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans can be seen in daily operation at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. **7-16-1f** **ZENAS WHEELER.**

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

## REYNOLDS'

Patent Cut-Off and Governor,  
FOR STEAM ENGINES.

127 of these Invaluable Machines,  
ARE NOW IN USE  
In California and Nevada Territory, giving a perfectly  
regular motion and  
Saving 20 to 65 per cent of the Fuel.

### Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to act  
and least liable to get out of order of any Governor in use.  
It can be seen in operation at the Golden State Iron  
Works, and at the Stone Breaker, foot of Market Street,  
San Francisco.

### Clark's Steam and Fire Regulator,

For controlling the Heat or Blast by opening the Chimney  
or Valve in the Blast Pipe by the pressure of the  
steam in the boiler. It will regulate the pressure to a  
point on the square inch. It cannot get out of order  
and any person can put one up in an hour after the damper  
is put in.

### Ingersoll's Patent Drill Press,

With which drilling can be done the same as with the  
common reamer, and when small holes are wanted, it  
can be done four times as fast. The handle can be worked  
in any direction.

### Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.  
Steam Engines, Boilers, Pipes,  
Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest  
market rates.

### Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury  
to the iron. In use for the past EIGHT years.  
Refer to—Sug at Reinery, San Francisco,  
Cottell & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.  
E. T. STEEN AGENT.  
No. 33 Fremont Street, San Francisco.

## MOYNIHAN & AITKEN,

### Boiler Makers and Blacksmiths,

Mission, between Beal & Fremont Sts.,  
San Francisco.

N. B. All kinds of Boiler and Sheet Iron Work executed  
at the shortest notice, and on the most reasonable  
terms. Jy 29

## PUMPS!

### HARRISON'S

### California Lift and Force Pump,

WITHOUT VALVES OR PACKING.

Suitable for Mines, Fire Engines, Wrecking or Irrigation.  
This is the Cheapest, Lightest and most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

ALL SIZES;

Capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute—For sale by

### C. H. HARRISON,

PHOENIX OIL WORKS,

10-16 517 Front Street, San Francisco.

### 50 lbs. MARINE and

### Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for Hulls and Decks of Vessels  
from ground Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
or Bottoms of Ships, it is equal to a coat of Stone, and  
quite equal to Copper, no worms will ever effect it, and  
cheaper than any other paint.

#### DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur,  
three parts Mineral Paint, mix with Coal Tar and apply  
it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes  
of 50 lbs. each, or by the Pacific Metallurgical Works.

### 25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal  
to covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

#### DIRECTIONS:

HOUSE:—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil: if a lighter color is  
wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white  
Lead, mix with Linseed oil. Put it thick on a tin Roof  
as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. Forquet, Superintendent.  
WORKS, North Beach; Office, 509 Sac-  
ramento st., San Francisco.

## PALMER, HANSCOM & CO.,

## Eye, Ear and Throat.

## DR. DE CASTRO,

### Oculist and Aurist,

WHO HAS PRACTISED IN NEW  
York and all the principal cities of Europe with  
such unrivaled success, and from each place is in pos-  
session of the most eminent testimonials, may now be con-  
sulted upon diseases of these delicate organs, with a view  
to their permanent cure. Diseases of long standing thor-  
oughly cured. The Doctor employs his (by the Medical  
Society of London approved)

## Self-adjusting Artificial Tympanum,

For the relief of deafness, attended by loss or injury of  
the membrane tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1862. An animated discussion ensued on the reading of  
the paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state; the effect of the tympanum was instantaneous—  
quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

Mr. Editor—Having been afflicted  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it is with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to recom-  
mend Dr. De Castro's skill as an aurist.

JOHN REESE, Napa Valley.

James Callaghan, witness,  
San Francisco, Ju'y 30th., 1863.

[From the Daily Alta.]

San Francisco, June 30th., 1863.

ED'S DAILY ALTA:  
Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a number of the best and best justified since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearny and Market Streets, and undergoing un-  
der his direction, two operations, she has heard sounds  
very distinctly; and is now, I am happy to state in a fair  
way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skillful physicians  
and aurists in California, but up to the period of visiting  
Dr. De Castro, received no benefit.

### HEPBURN & PETERSON'S AMALGAMATOR.

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

#### GOLD AND SILVER ORES,

manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the miner a more expeditious and perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machines now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.  
 nov 8 San\* HEPBURN & PETERSON.

VOL. VII. SAN FRANCISCO, MONDAY EVENING, NOVEMBER 16, 1863. NO. 3.

## ROCK DRILLING BY MACHINERY.

The production of a reliable and practical Rock Drilling Machine has long been considered a most important desideratum. Even in the Atlantic States the demand for a machine of this description in running railroad tunnels, in removing ledges, in the process of grading railroads, etc., has long been urgent, and has prompted numerous inventors to try their ingenuity in this direction. Attempts have been made to devise machines for boring out the entire diameter of the tunnel by ingeniously devised cutting instruments, but without achieving any practical success. Other attempts have been made to work smaller borers, on similar plans, so as to reduce the ledge or face of the tunnel to a honeycomb condition, in which it could readily be knocked away by hammers, etc. All these experiments have proved failures at the expense of enormous sums of money, from the fact that too much was attempted, and quarrymen, miners and others interested had pretty much settled down into the conviction that, while almost or quite every branch of human labor might be aided more or less by machinery, the common hand, or churn drill would have to continue to all time as the only method by which men could work their way into the solid rocks which comprise such a vast proportion of our mundane sphere.

It was just at this point, however, that a couple of ingenious Yankees concluded "it would never do to give it up so," and resolved, each unknown to the other, that if a whole loaf was unattainable, a half of one might be better than no loaf at all; so they each set their wits to work to devise some method for drilling the holes merely, still employing gunpowder, as heretofore, as the chief agent, for removing the rock. The idea was a most happy one, for really the chief labor lay in this very work of drilling—the act of removing the rock by powder, was a small work after the hole was drilled. The wear and tear of metal—the friction and resistance—necessary to be overcome to chip away all, or nearly all the rock in small pieces was quite too much to render any such machinery of any practical value. Well, as we have already said, our two ingenious Yankees went to work and as good luck would have it, the one pitched upon the "churn drill," while the other took the "hand drill," as his starting point.

After some two or three years of careful study and experiment each has brought out what appears to be a most eminently practical machine for rock drilling—the one operating on the principal of the "churn drill" and the other on the "hand drill." The names of these two inventors, who we feel fully convinced have brought out a machine which will soon be acknowledged as of immense practical value to California, are WILLIAM W. DUNN, who may be found at No. 9 Front street, and Mr. J. S. FRENCH, who may be found at the Miner's Foundry, on the same street, in this city.

By one of either of these machines one man may do the work of at least four men in the ordinary way. Mr. Dunn's machine, which operates on the principle of the "churn drill," has already been put to practical test in this State, and certificates of its practicability may be seen as well as the machine itself in operation at his shop, as above. Mr. French's machine operates precisely like the ordinary hand drill—the

blow being given by a hammer, which strikes upon the drill as in ordinary hand use. We shall have more to say of these machines at a future time. In the mean time we would advise all interested in tunnelling operations to call and examine them, as above, and judge for themselves of their practical and comparative merits.

## EL PASO MINES.

Our El Paso Correspondent, "C. W. T.," writes us that the excitement in that neighborhood with regard to the new placer diggings two or three hundred miles to the east of that locality, has drawn away the chief portion of their "hired help," and that the mine proprietors there are left to carry forward their projects as best they can without help. He thinks the mines of that neighborhood will have to lie idle until the "tide turns." Our correspondent has probably seen this witnessed a pretty strong flow of the return tide, from which we presume our El Paso friends will derive some gain in the way of an abundance of labor at a fair rate.

Our correspondent further writes that "a lot of splendid ore goes up this week (Oct. 22nd), from the Yarbrough Company, but their work has closed for a time, and the Superintendent is now going to headquarters to make a new start. The frame work of Messrs. Navbree's arastras has arrived, and in a few days they will see what they can obtain from the Rochester gold lead. Our hopes of El Paso are as strong as ever, but we must wait patiently and bide our time."

THE SAN FRANCISCO DIRECTORY for the year commencing October, 1863. Mr. H. G. Langly, the compiler of the above work, has favored us with a copy, and we esteem it as no ordinary favor. The book is full of valuable information touching every leading interest of our city, and should be in the hands of every business man. The Directory proper contains 455 pages—in addition to which are 131 pages of advertisements made up from the principal business houses of the city. A large, well executed and very full and correct map of the city accompanies the work. The book is from the Press of Town & Bacon, and is a highly creditable specimen of that class of work. We trust the enterprising proprietor will be amply repaid for his well applied industry.

MAP OF EL PASO.—We have received from Mr. W. Holt, the publisher, at 305 Montgomery street, a copy of a New Map of El Paso Mining District. The map embraces the localities of Grape Vine City, El Paso City, Ophir City and the Laurel Hill Mining District. All the principal mines throughout a range of country 25 miles long by 12 broad are distinctly laid down, together with a very distinct representation of the topography of the region. The map is for sale by Mr. Holt.

COPPER INGOTS.—The United States Mining Register published at Philadelphia, in its issue of October 10th., says that copper which in the ingot was quoted that day at thirty-two cents per pound, showing an advance of a fraction over fifty per cent.

GOLD MINING NEAR PLACERVILLE—CORRECTION.—In our notice of mining operations at Poverty Point, near Placerville, in our issue of the 2nd. ult. we were mistaken, with regard to the New El Dorado Co. We remarked that the operations of this company "had been tied up in law for nearly a year." A note from one of the proprietors corrects us as follows:—

"The Company owns four different claims. The one on which work has been suspended is claim No. 3., but the principle one, and by far the richest and most extensive, situated on Clay Hill, near Big Cannon, has been and still is being worked regularly, by the Company. Its prospects are very flattering. It contains four different ledges respectively called, from the color of the surface rock, yellow, white, black and red. A shaft 55 feet deep has been sunk on the red lead, which at that depth presents a solid body of quartz six feet wide, rich in gold uniformly diffused through the rock. The White and Yellow leads have been opened by large cuts, and several hundred tons of rock extracted therefrom, which prospects well. A tunnel has been for some time in progress which is to cut each of these four veins at right angles. The indications are that very rich rock will be struck in this tunnel, which will reach the furthest lead at the depth of about 150 feet from the surface. A mill will be erected near the mouth of the tunnel. The location of these lodes is all that could be desired, being near the flourishing town of Placerville, with an abundance of wood and water convenient. The Harmon lead runs parallel to the veins above mentioned.

THE MECHANICS' INSTITUTE FAIR.—At a recent meeting held at the Mechanics' Institute, the subject of holding an Industrial Fair by that Association next September, was freely discussed. Several of the officers and prominent members took part in the discussion, and stated that from careful investigation they were satisfied that a Fair held by the Institution next September would not only be a pecuniary success, but would tend greatly to stimulate the mechanical interests of the State. The matter was referred to the officers of the Institute, to take initiatory steps in securing private, municipal, or State aid in furtherance of the project, and to report the same to a meeting of the members, to be held on the 20th instant. We trust the project will succeed.

OUR HOME MINES.—The Suburban Mining Company, located near the Mission in this city, has levied an assessment of one dollar per share, for the purpose of re-commencing work on their tunnel. We understand that the prospects of the company are highly encouraging, and that it is the intention of the Directors to prosecute the work of developing their ledge with vigor.

THE GOLD HILL NEWS is the title of a neat and ably conducted daily paper, which has recently been started at Gold Hill, near Virginia City. We recognise in the name of one of its proprietors, a friend of other days, when the printing business in California was but in its infancy. The News is the representative of a most important locality on the Eastern Slope, and we trust it will receive that support and encouragement which it appears so well to merit. It is a most welcome visitor to our table.

## KUSTEL'S PROCESSES OF SILVER AND GOLD EXTRACTION.

Among the items to which we may today call favorable attention is one noticed on page 121. An instance is there narrated which occurred in the author's practice in Mexico. He there states the result, "metallic copper in place of iron" (in barrel amalgamation) "acts with little less energy than the iron, but not reducing the copper and lead chlorides to the metallic state, it renders a very pure amalgam."

Another process to which, however, Mr. Kustel makes some objections in view of the fineness of pan amalgamation, is of interest from its analogy with Patterson's lead process. It is due to Mr. Sutro. Mr. Kustel writes thus:

It is known that the silver amalgam that is obtained in the pan amalgamation, consists of regular crystals which are suspended in the quicksilver. The lead amalgam, on the contrary, is entirely dissolved in the quicksilver when hot. If, therefore, the quicksilver is pressed through a cloth while hot, the dissolved lead amalgam is found in the quicksilver, and the silver amalgam in the cloth. A second filtration of the quicksilver when cold, gives the lead amalgam. The lead contains three or four per cent. of silver.

We intend next week to present some comparative statistics of Californian and Australian pan amalgamators.

## IMPORTANT TO WASHOE OPERATORS.

By a law of Nevada Territory, persons who may have cases for suit in claim for Mining Ground in that Territory, must have their complaints and answers filed before the 21st. of November, inst., or their claims will be forever thereafter barred. Persons who think they have claims for mining ground, now in possession of other parties, and for which they are intending to bring suit, will do well to take notice of this item, or they will lose the opportunity to secure their just rights.

A NOTABLE DEATH.—Oliver Ames, of North Easton, Mass., died at his residence on the 11th. of September last, aged 86. But few men have lived in private life in this country, more universally or more favorably known among the laboring classes than Mr. AMES. He was one of the first among American Mechanics to undertake on anything like an extensive scale, the manufacture of shovels. He began business, when quite young, with limited means, and under circumstances which would have utterly discouraged almost any other man; but by a course of industry, integrity and energy seldom displayed, his business rapidly increased and the reputation of his work excelled that of all others on the continent. Mr. Ames never made a poor shovel. It was our privilege to visit his establishment, and make his acquaintance some 26 years ago. We never met a more unassuming man, or one more beloved or respected by his employees. Even at the time of our first visit, which was often repeated at subsequent intervals, he had acquired a handsome fortune, and entrusted his business mainly to his sons; yet his mode of life was plain and simple. He never, to the time of his death, made any ostentatious display of his wealth. He lived to a good old age, and died, at the close of a well spent life, respected and lamented by all. His life may justly be regarded as an example for every American mechanic.

Among the inventions recently announced is a "ship's berth boat," intended to prevent sea sickness. When used as a berth it accommodates itself to the motion of the vessel after the manner of a mariner's compass. In case of shipwreck, it may be used effectively as a life-boat.

REMARKABLE OCCURRENCE.—A negro cook in one of the regiments on Morris Island lately conceived the idea of making sinkers for fish lines out of the lead around Parrott shot. To this end he placed a shell in a stove and sat down, ladle in hand to catch the molten lead as it fell. Just about the time the lead should have fused, the stove separated into very minute fragments, and the last seen of the smelter was a series of involuntary gymnastics creditable to his agility but unpleasant from their abruptness.

THE BOISE MINES.—Many persons are ignorant of the location of the Boise mining country. They are located about three hundred miles south of east from the Dalles, Oregon; Umatilla and Walla Walla, Washington Territory; and some two hundred and twenty-five miles east of south from Lewiston, Idaho Territory.

STEAMER FOR TAHOE.—John A. Crocker, of Sacramento, is going to Lake Tahoe, to construct a small steamer for navigating that romantic sheet of water.

THE MOUNT DIABLO COAL MINES are now sending to market about 4,000 tons per month, the quality of which is constantly improving; it is now selling by the cargo, afloat, at \$10 per ton. Coose Bay Coal, (Oregon) has been sold at the same price, which is also the present market value of that from Bellingham Bay. The steamer Esmeralda, which tows vessels on the Sacramento river, uses coal from the Mount Diablo mines, which it procures at Antioch. The boat has used this coal for making steam for some time, and its owners have great faith in it. Antioch is the location of the Copper Smelting Works, which are also using the Mount Diablo Coal.

The consumption of domestic coals is constantly on the increase, consumers being driven to its use by the high rates ruling for all other coals and firewood. This latter article is now very scarce and high, and readily commands by the cargo \$10 @ \$12 per cord.

NATIONAL FINANCES.—It has been calculated that the present war imposes an average burthen of \$20 per head upon each man, woman and child in the loyal States. Great as this tax may seem, it is nothing to the burthen imposed upon the people of England during the six or eight years of the Napoleonic war, which was calculated at an annual levy of \$41 per capita, or a little more than twice the tax now resting upon this nation. It should also be borne in mind that the loyal States are now far better able to bear even the burthen which England sustained from 1809 to 1816, than that nation was then, inasmuch as we have now reached a ten fold greater degree of development, in resources and commerce, than Great Britain had fifty years ago. These figures and facts are sufficient to show pretty conclusively the ability of our people to bear the burthen imposed, and the folly of those financial croakers who are predicting anarchy and confusion as the result of our present extraordinary national expenditures. Those who make these predictions, whether among our own people or abroad, understand but little of the character of loyal Americans. The recent elections, even if we ignore all past history, afford abundant evidence that there is no place in all this great republic, for a party which would inscribe upon its banners the repudiation of any engagement necessary to sustain the integrity of our government or the permanency of the Union.

THE DEBT.—It is stated semi-officially that the Government enters upon the third year of the war with a debt of \$1,220,750,000. Acting-Secretary of the Treasury Chittenden is reported to have said, in the course of his remarks to the Ohio soldiers in Washington, about a year ago, that foreign capitalists were beginning to invest extensively in Government securities. In a single day \$350,000 worth of United States bonds were issued on foreign account. The money for the payment of the entire army to the close of November, which the Government now has on hand, was advanced by foreign houses.

FOREIGNERS.—It has been estimated from facts obtained from the census and emigrant reports, that the number of foreigners in the loyal States, at the present time, including the children of foreigners born since the arrival of their parents in this country, exceeds one-third of the entire population of those States. The number of naturalized citizens in the entire Union, it appears from the recent census, is 4,136,000, made up of the following nationalities:—

Ireland.....	1,611,000	Italy.....	10,000
German States.....	1,198,000	Denmark.....	10,000
England.....	430,000	Belgium.....	9,000
English N. America.....	230,000	Poland.....	7,000
France.....	109,000	Mexico.....	7,000
Scotland.....	105,000	Antill s.....	7,000
Switzerland.....	53,000	China.....	5,000
Wales.....	45,000	Portugal.....	4,000
Norway.....	43,000	Russia.....	3,000
Holland.....	28,000	Turkey.....	28,000
Sundry.....	204,000		
Total.....	4,136,000		

CALIFORNIA AND JAPAN.—The New York Stockholder of October 6th., says:—"Parties interested in the trade between California and Japan are in town, looking about for fast steamers. It is proposed to form a line from San Francisco to Japan. The steamers, will naturally, be armed, and will probably be provided with letters of marque by their government, or by the princes of Japan, so as to be available in case of war between Japan and any other nation. In view of the relations between Great Britain and Japan," it adds, "it is hardly probable that our shipbuilders will supply the vessels required."

COPPER.—"We learn," says the Calaveras Chronicle, "from gentlemen who have lately visited the mines in Campo Seco, that the copper mines of that famous district are constantly improving; three of them are raising and shipping the finest quality of ore. Parties are prospecting for lodes in the neighborhood with every probability of ultimate success. It is now pretty generally believed that copper cannot be found near the surface, and companies are sinking their shafts the depth of from one hundred to two hundred feet before they lose confidence in their work. If found, a good claim is a fortune to the lucky miner, and will be a permanent source of wealth to the community. Unlike the early gold diggings, which generally gave out by the time a town had been burned out once or twice, a copper district will warrant business men in putting up fire-proof buildings, and insure permanency to even a California population."

ARTESIAN WELL AT NAPA.—The California Steam Navigation Company are sinking an Artesian well at Napa, for the purpose of supplying their boats at that place with pure spring water for steam purposes. Experience has satisfied the company that the damage to boilers and machinery from the use of the brackish waters of the Bay and rivers is more expensive than the cost of procuring pure water in the manner indicated. The well has already reached the depth of 260 feet, and the company are confident in the belief that they will soon find the desired supply.

LAND AND NAVAL PRACTICE.—It is accounted as a singular fact, (if it is a fact,) as recorded by our Eastern exchanges, that while not a single accident has occurred to the guns on board the Ironsides and Monitors, five of Gen. Gilmore's guns of the same calibre as those used by the navy, have exploded or become damaged since the siege of Charleston began. Experienced naval officers explain this by the fact that the projectiles used by the Monitors were "slashed" or greased before being rammed home.

THE FLUTED NAIL.—The London Builder says a company has been formed to bring into practical use a spiral fluted nail, recently invented in England. They are fluted and twisted in a machine, and are manufactured as cheap as common nails. The holding qualities of the nail are remarkable; no holes are required to be made before driving those of any size, and there is no danger of the board splitting, however near to the edge the nail is driven. The spiral point causes the nail to revolve as it advances, and its tenacity of holding is equal to that of a wooden screw.

PRICES OF COTTON AND COTTON FABRICS.—At a sale of cotton, October 8th, in New York, on Government account, 806 bales of Upland were sold in small lots, at prices higher than have been obtained at any other time since the outbreak of the present war. That which was in good condition averaged from 90% @ 92c. One lot in rather bad order brought 82% c., about the average price of Upland cotton for the year past. The market for cotton cloth, in New York, has recently advanced very materially. Standard sheetings, on the 12th ult., were quoted at 40c. and upwards; standard printing cloths at 17c.; madder prints at 25c., with a light business. Woolens have also advanced, but not in proportion to cotton.

ABOUT 300 men are now engaged in gold mining on the Chaudiere river, near Quebec, C. E. The gold found there is in the form of small pellets, and is very pure; but searching for it is tantalizing. Some men will labor for days without obtaining a single grain, while others will make about \$50 dollars per day.

SEX OF EGGS.—Poultry fanciers have for a long time been endeavoring to find the sex of the chicken that would be produced, by the peculiarity of the egg. Two plans have recently been circulating through the papers: first—rough ends will produce cocks, and smooth ends, hens; second—if the air-bubble is in the center of the end, a rooster, and if at one side, a pullet will be hatched. Chas. H. Graver, a Long Island farmer, who does not take all he sees in print for granted, has experimented with the following result: first—of nine birds hatched from rough end eggs, seven were hens, and two, cocks; second—of thirteen birds hatched from eggs with the air bubble on one side, seven were cocks, and six were hens. So both these theories were upset.

**G. E. MOORE,**  
Assayer and Analytical Chemist,  
No. 612 Sacramento Street,  
HAVING ESTABLISHED A CHEMICAL LABORATORY,  
furnished with every requisite for delicate Analytical  
work, is prepared to execute the Assay and Analysis  
of Ores, Mineral Waters, Guanos, etc., with accuracy  
and dispatch.

Messrs. F. PARROT & CO., Messrs. ALSD & CO.,  
R. B. SWAIN, Esq., DONOHUE, RALSTON & CO.  
CHAS. F. RIEHN, late U. S. Branch Mint, gives Lessons in  
Assaying, also in Mineralogy and Chemistry as far as  
required to become a practical Assayer.

**AGENTS WANTED.**  
We want a good Agent in every city, town and settlement,  
on the Coast. Applicants will send their names  
with reference, when specimen numbers of the **Min-  
ing & Scientific Press** will be forwarded to them,  
and their names added to our published "List of Agents."  
EWE & SMITH.

WM. H. MEAD, THEODORE VAN TASSEL.  
**MEAD & VAN TASSEL,**  
**HATTERS,**  
Montgomery st., cor. of Commercial,  
SAN FRANCISCO.

TO OUR FRIENDS AND THE PUBLIC GENERALLY.  
Having Purchased the entire interest of Messrs  
FISHER & CO., in this city, we shall, on the 1st day of  
May assume the management of the

**HAT EMPORIUM,**  
so long conducted by that firm.

Mr. WILLIAM H. MEAD, for the last seven years, Sales-  
man with Messrs Fisher & Co., respectfully solicits a con-  
tinuance of the patronage so long and liberally bestowed  
upon the old House, feeling entire confidence in our ability  
to suit in every particular.

Mr. THEODORE VAN TASSEL, for eight years with  
Messrs Le Gay & Co., would be pleased to see his friends  
at his new place of business.

The long practical experience of Messrs Mead & Van  
Tassel in the Trade justifies them in saying that their  
work cannot be excelled either in finish or durability.  
Having perfected arrangements, we shall be in constant  
receipt, by every steamer of soft goods of the very finest  
French and American Manufacture.

Our Stock now on hand is superb.  
Call and examine, and judge of the merits of our claim  
to the title of "LEADERS OF FASHION."  
Respectfully

**MEAD & VAN TASSEL.**  
Montgomery street, cor. Commercial.

**New Style of Ladies' Buckle!**

**W. BOHM,**  
INVENTOR AND PATENTER.

THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the  
construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
possesses several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
It excels all other buckles in

Usefulness, Strength and Appearance.  
The Public is respectfully invited to call and examine  
this Buckle at the Jewelry Establishment of

BRAVERMAN & LEVY,  
621 Washington Street, San Francisco.  
JOSEPH BROTHERS,  
607 Montgomery Street, San Francisco.  
FLOBERG & CONRAD,  
118 I Street, Sacramento.  
Agents for the Patentees.

Every Buckle sold, stamped "W. Bohm," will be  
guaranteed as to its Strength and Durability.  
W. BOHM, Patentees.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

### METHOD OF CRUSHING ORE.

The BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1860, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 8,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co. Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,  
San Carlos Mining Co., Owen's River,  
Union Quartz Co., Aurora,  
Triunfo Mining Co., Mexico,  
Napa Quartz Co., Aurora,  
Petaluma Quartz Co., Gold Hill,  
Francis Mellus & Co., Slate Range,  
W. R. Churchill & Co., Mexico,  
Willow Springs Co., Coso,  
Hews, Howe & Co., Rich Gulch Flat,  
F. A. Benjamin & Co., Mexico,  
O. J. Parker & Co., Nicaragua,  
Gibbons & Clayton, Esmeralda,  
Smith & Clouser, S. F. Reduction Works.  
Amagoza Mining Co., San Bernardino,

MANUFACTURED ONLY BY  
**GODDARD & CO.,**

At the Pacific Iron Works.

SAN FRANCISCO.

nos 125 to 136 First street, and 126 to 144

Fremont street.

## MINING & SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it in-  
teresting and valuable information to any paper yet  
published

### The Inventor!

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his Patent, the proprietors having had  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patents  
with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of useful matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

### The Mining Interest!

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Min-  
ing Stocks, new inventions of Machinery adapted to that  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

### To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of infor-  
mation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
tists will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gener-  
ally will be amply discussed.

### Terms.

To mail subscribers:—Four Dollars per annum.]

### Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Names can be sent in at different times and from  
different Post-offices. Specimen copies will be sent  
gratis to any part of the country.

## PEOPLE'S OPPOSITION Steamship Line!

Special Notice.—The Line have been withdrawn from the Ni-  
caragua Route until further notice.

### GREAT REDUCTION IN RATES!!!

The Fast and Favorite Double Engine Steamship,  
**MOSES TAYLOR,**  
J. H. BLETHEN.....COMMANDER  
Will be dispatched for PANAMA  
From Mission street Wharf.  
**FRIDAY, - - - - - NOVEMBER 13, 1862**  
Punctually at 9 o'clock, A. M., on  
Connecting at Aspinwall, by the Panama Railroad, with  
the Splendid Steamship  
**ILLINOIS - - - - - 2500 Tons.**

The Moses Taylor, since her 1st trip has undergone  
the most extensive repairs. Her decks have been ex-  
tended forward and aft; cabins enlarged, refitted and  
repainted throughout—making her accommodations equal  
to any Steamer on the ocean.  
For further information or Passage, apply to  
I. K. ROBERTS, Agent,  
No. 407 Washington Street, San Francisco,  
Opposite the Post Office.

## BOOK KEEPING, Penmanship

AND  
**COMMERCIAL CALCULATIONS,**  
Taught by J. S. LUTY  
**PRACTICAL ACCOUNTANT,**  
305 Montgomery Street, Corner of Pine.

### TO QUARTZ MINERS.

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centre and passes under it, between the grinding sur-  
faces, to the circumference: from whence it passes again  
over the muller to the centre, through the holes and be-  
tween the grinding surface to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the parties infringing. My Amalga-  
mators can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.

## CALIFORNIA MINING INTERESTS IN NEW YORK.

The New York *Stockholder*, after noticing, at some length the receipt of the first issue of our "Mining Directory," and the accompanying remarks upon the mining interests of the Pacific coast, adds:

"But the remarkable movement of organized capital, now going on in California, is certainly something more than a mere speculation. It answers a public want. Untold riches lie buried in that country; to bring it to usefulness and develop it, organized capital is necessary. The opening and working of our mineral deposits, throughout all the States, are but in their infancy. People will invest more and more their spare money in mining operations, because, in spite of many failures, in spite of fraudulent speculations, they feel that there is a degree of certainty in them, which no other field of industry can afford. With a sufficient capital, with integrity and ability, mining companies cannot fail to be profitable concerns to their stockholders. Patience also, and perseverance, are conditions required to be successful. Some years ago, stocks of some mining companies of San Francisco could be bought for a piece of bread, because, after a small expenditure for development, they were unable to pay any dividends. The original shareholders who got rid of their stock, at that time, were losers of course; but those who purchased stock and kept it have been singularly rewarded for their perspicacity.

There is no speculation having a greater character for certainty than mining operations, provided they are properly conducted. When mines have gone through a process of development to ascertain their value; when indications of a metal in sufficient quantity have been obtained, there is no reason why those mines should not become good and paying dividend concerns. California is too far from the action of our capitalists; but the movement so energetically going on in that State to foster the mining interest, is an indication that large profits await those who will invest their money in nearer States or Territories, for the purpose of developing their mineral wealth. Colorado seems to us the most promising field for New York energy and capital; for we believe that it is destined to repeat the marvels of California, regarded till to-day as the mineral wonder of the world."

**CARELESSNESS IN USING GAS.**—The late unfortunate accident by which a promising and intelligent lad of this city lost his life, should operate as a caution to persons using gas, especially in families where children or domestics, often unused to gas, may have occasion to employ it. Many persons have a habit of lowering the gas light in their bedrooms to a faint et al night. This, to say nothing of its pernicious influence upon the health, may be productive of serious accidents. When the gas is reduced so low, a very slight cause—the buzzing of a fly even—will serve to put it out, and the sleeper is left to inhale a poisoned atmosphere, or to incur the risk of an explosion should any one chance to enter the room with a light. Where gas lights are thus lowered, a glass should always be used as a protection to them. Many fires have occurred in consequence of the dim light, not noticed after sunrise, on the window being opened by the occupant or servant; the curtain is blown against the burner and a fire ensues."

## ESMERALDA STOCK REPORT.

But little business is being done at Anrora in the way of transactions in mining shares, by reason of the great scarcity of money there. The principal transactions are consummated by parties from this city, at a very low figure. Owing to various untoward causes, which will soon cease to exist, many a hard working miner, in that region, has been, or soon will be compelled to part with valuable feet at a sacrifice to supply actual wants.

We notice among the latest quotations, the following:

Twenty shares Western Summit, \$13 bid; 20 shares Lexington, \$15 bid—20 asked; 75 shares Cortez, \$4 asked; 5 shares Utah, \$45 bid—60 asked; 10 Crockett, \$40 bid—60 asked; Ural, \$175 asked; 50 shares Dora d, \$13 bid—20 asked; 10 shares East Del Monte, \$20 asked; 10 shares Mulberry, \$10 asked; 25 shares Fly-Away, \$10 asked; 10 shares Locomotive, \$25 asked; 10 shares Pittsburg, \$15 asked; 75 shares Rosalie, \$4 asked; 10 shares Stonewall, 25 asked; 75 shares Ada, \$2 asked; 200 shares Dashing Wave, \$2 asked; 10 shares Western Tunnel, \$15 asked; 10 shares Clan Alpine, \$4 asked; 25 shares Cortez, 4 asked; 10 shares Durand, \$25 asked; 50 share Gov. Stanford, \$3 asked; 25 shares Napoleon Tunnel, \$5 asked; 50 shares Rosalie, \$4 asked; 25 shares Yankee Jim Tunnel, \$4 asked.

## THE COPPER INTEREST.

One of the most encouraging features with regard to the copper interest is the immunity which, as a general thing, it has thus far secured from the speculative mania which has so completely enveloped everything in the way of silver mining. Holders of copper shares, of real or perspective value, appear to be satisfied with their ventures or investments. *per se*, and seemed to have little care for any speculative operations. Every one who has got a few feet in a developed or highly promising copper mine seems to have arrived at the conclusion that copper is to be the stand-by—the sure thing, for permanent investment; and but few are found in the market with their "feet." The permanency and uniformity of mines of copper are well known, and the fact that but little machinery, and that of the simplest and most inexpensive character, is required to dress and concentrate the ores, which immediately on such preparation have an easily ascertained and standard value, renders it extremely difficult to "operate" in copper. The thousand and one cases of "sharp practice" which are so easily concocted in the development and management of silver mines, are almost universally impossibilities when applied to the baser metal. A copper mine, as a general thing, after the bed of ore is once struck, can be so managed as to very nearly or quite pay the way to its fullest development. The day that a ton of ore is raised to the surface its actual value can be ascertained, and capitalists stand ready to advance very closely approximate to its full worth, and take the ore from the very mouth of the mine. Copper, of all the high priced metals, is the one in which capitalists of either large or small means, can most safely invest, or the miner, with no other capital than stout arms and a willing heart can most conveniently embark.

We continue to hear favorable accounts from old copper localities, and new discoveries are almost daily announced. During the past week we have heard of "most wonderful developments" in Indian Valley, about forty miles northwest of Colusi. It is reported that specimens of almost pure copper are taken from the ground, in large quantities, but a few feet only from the surface. One correspondent says "you can find copper in chunks all over the surface, ranging from 45 to 90 per cent. and the best in the State. Pieces have been found weighing ten pounds, containing nine pounds of copper," and again, "the people from all the surrounding country started of, [for the locality] some in buggies, some on horseback, and some two on a mule."

Again, far to the south, and from near the extreme limit of the copper belt, so far as traced in that direction, we find the following item:—

**COPPER PROSPECTS IN TULARE.**—The copper prospects in the new mines on the Chowchilla, are improving. A specimen, about four ounces in weight, was lately taken from the "Tom Early" vein, completely studded with pure copper.

The Gardiner Company, a few miles above Auburn, have struck a well defined ledge, fourteen inches in thickness, which, it is said, will assay from twenty to thirty per cent.

FROM THE COLORADO we also continue to hear most favorable reports. From a gentleman, skilled in matters, mining and metallurgical, who has recently spent some considerable time in that region, we learn that the fears which have hitherto obtained to some extent with regard to the permanence and reliability of the mines there, are entirely without foundation. He assures us that the copper mines of Colorado present as strong indications of continuity and depth as any other mines in the State, and that the general geological features of the country are as favorable as could be desired. This gentleman has promised us some account of his experience and observations in the Colorado mines. Late letters from that locality state all is prosperity in the mines on the Colorado, and that "new discoveries were of almost daily occurrence. A number of companies were getting out ore for shipment. One or two warehouses are in progress of erection at the La Paz landing. The steamer *Cocopah* was discharging a large cargo of miners' supplies at the La Paz landing, October 22d. She would carry below a number of tons of ore, which had been delivered at the landing by Mr. Tyson for shipment."

Dr. H. T. Stevens, the agent for the Colorado Steamboat Company at Fort Yuma, recently arrived at Los Angeles, reports that the boats, on their last trip up the Colorado, took tools and supplies for twenty companies, who intend opening the different leads along the river, and large ship-

ments of ores will soon arrive in San Francisco from that section.

The ship *Invincible*, which has just loaded at this port for Boston, has a large quantity of copper ore on board.

The ship *Industry*, now loading for Europe has 90 tons of copper ore on board from the Arroyo Seco, a very promising mine, recently opened about three miles from Lone City. This ore is shipped by Wm. Shiels, Esq., of this city. The same company have also sold another lot of similar ore to the Antioch Copper works.

## THE MINING SHARE MARKET.

The Mining Share Market still remains quite active, but transactions are chiefly confined to a few leading shares, most of which are in request at enhanced prices. The recent assessments upon unproductive companies has had the effect to induce many outside holders to close out their investments in that class of stock, often at grievous loss. Speculators in shares, who have been quite generally sorely pressed of late, have also been compelled to part with much of their productive and high priced stocks, to enable them to meet calls for assessments.

With the exception of the more prominent and dividend paying shares, mining stocks are at present unavailable as a basis for negotiating loans. Hence the resort to sales, and the recent activity in stocks, in the face of a very general distrust in that class of investment. This activity has been also due, in no small degree, to the calling in of loans, consequent upon the late action of the bankers, which has precipitated upon the market a large quantity of hypothecated stocks.

The business of the week has been chiefly confined to the Ophir, Burning Moscow, North American, Baltic and Sheba, with little variation from prices of previous week.

The Ophir has been the chief feature of the week. A large business has been done in this stock at greatly fluctuating prices; 948 shares have changed hands. These shares opened the week at \$1430, advanced to \$1630, on the strength of the reported discoveries in the mine, but again weakened and closed at \$1390 bid with sellers at \$1400. Dividends for this month have been sold at from \$30 to \$48, and for three months to come at as low an average as \$29.50 per month.

The editor of the *Prices Current* of the 12th inst. accounts as follows for the recent extraordinary fluctuations in this stock:—

The fluctuations in the stock of this Company are attributable to a variety of causes: First, It has been largely hypothecated. Many of the holders, availing themselves of its acceptability to capitalists as collateral, had borrowed large sums upon the pledge of it, and to a very great extent these loans had been employed in the speculative purchase of other stocks of comparatively little value. The downward tendency of the market, and the general unsaleableness of the stock thus purchased, compelled the parties, when pay day came, to realize upon the Ophir as the only resource. Hence free sales became necessary, and the market was precipitated. In addition to this, it may be stated that a good deal of dissatisfaction has existed with regard to the management of the Company's affairs. Prominent officers in it have been at variance—its expenses have been very heavy—an important suit has terminated unfavorably, and under circumstances adapted to increase any odium that may have before existed against the company. The "Bears" have made the most of all this, adding various embellishments to suit their own purposes.

We have taken some pains to inquire into these matters, and are assured from authentic sources that the mine itself both looks and yields as well as ever, and shows no indications of giving out. The enormous expenses of the last month—some 90,000—compelled the trustees to reduce the dividend below the usual figure; but they do not expect a continuance of this, and they aver that the prospects of the mine under proper management are as good as ever. These views are entertained by many parties who sold out with the intention of reinvesting at lower figures, and have done so, under the impression that the causes at work would force prices to a low point, and that reformation in the management of the Company's business was all that the case required. The annual election of trustees will take place in a few weeks, and in the mean time, the pressure of hypothecated stocks upon the market being over, and the true conditions of things pretty generally understood, the stock has rallied handsomely without reaching the low point anticipated.

Burning Moscow still continues to be the favorite speculative claim, and has been largely dealt in—\$848 shares having changed hands at from \$272½ @ \$325. It is stated that this mine now presents a very favorable appearance, and that a large yield of Bullion may be confidently expected, w

Silver Hill at \$20 ; Ural at \$130 ; Utah at \$48 ; Bamboo \$30, and Esmeralda \$18.

**GREEK FIRE.**—Speaking of the Greek fire with which Gen. Gillmore has been experimenting at Charleston, a writer in an English scientific journal expresses the opinion that the substance "might be so formed that it would actually burn under water." What the English writer thinks "might" be done really has been accomplished at Morris Island; several experiments to test the powers of the fire in that way having succeeded admirably. It was also tried under ground. A can filled with it having been placed in a hole dug four feet deep in a sand hill, and then covered up, the earth being soaked with water and batted hard down upon it. On removing the earth, in the course of a minute or two, the substance was found to have burned itself entirely out.

The writer just alluded to states that Scott, the inventor, offered his discovery to the British Government during the Crimean war, but was so discouraged and disgusted with the "circumlocution management," which it was necessary to go through with, that he withdrew his offer, and finally placed his invention in the hands of the Federal Government.

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented of securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

### WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the said. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\*.\* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. sep16-1f ZENAS WHEELER.

## PUMPS!

### HARRISON'S

### California Lift and Force Pump,

WITHOUT VALVES OR PACKING, Suitable for Mines, Fire Engines, Wrecking or Irrigating. This is the Cheapest, Lightest and most Durable, and least liable to get out of order, of any Pump yet invented.

### ALL SIZES;

Capable of throwing from ONE HUNDRED to FIVE THOUSAND Gallons per Minute—For sale by

### C. H. HARRISON,

PHOENIX OIL WORKS,

1e-15 617 Front Street, San Francisco.

### 50 lbs. MARINE and

### Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from Ground. Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

### DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil. For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

### 35 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

### DIRECTIONS:

HOUSE.—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil; if a lighter color is wanted, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years. S. C. BRADSHAW, Agt., G. T. TORQUE, Superintendent.

WORKS, North Beach; Office, 509 Sacramento st., San Francisco.

## DR. DE CASTRO,

Oculist and Aurist,

WHO HAS PRACTISED IN NEW York and all the principal cities of Europe with such unrivalled success, and from each place is in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. He has a long standing thorough cure. The Doctor employs his (by the Medical Society of London approved)

## Self-adjusting Artificial Tympanum,

For the relief of deafness, attended by loss or injury of the membrana tympani, and the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," &c.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November, 1861. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state; the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

Mr. Editor.—Having been afflicted with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent an operation, and it is with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist.

James Collaghan, witness, San Francisco, Ju y 30th, 1863.

[From the Daily Alta.]

San Francisco, June 30th, 1863.

DR. DE CASTRO'S: Permit me through your widely circulated journal, to say, that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearny and Market Streets, and undergoing under his direction, two operations, she has heard sounds very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physicians and aurists in California, but up to the period of visiting Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT, 812 Green Street.

**Silver Butte Consolidated Silver Mining Company.**—Notice is hereby given that on SATURDAY, December 12th, 1863, at 10 o'clock A. M., there will be sold at public auction, at the office of the Company, so many shares in the Capital Stock of the Silver Butte Consolidated Mining Company standing in the names of the following persons as may be necessary to pay all assessments now due by said parties, together with all expenses of advertising and sale, unless said assessments and charges are previously paid:

**HEPBURN & PETERSON'S  
AMALGAMATOR.**  
The subscribers would call the attention of the Mining Public to their Reducor and Amalgamator, and also to their Separator for reducing and separating the mineral from

**GOLD AND SILVER ORES,**  
manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.  
These machines secure to the miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machines now in use for producing similar results. This fact is attested by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Yephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

VOL. VII. SAN FRANCISCO, MONDAY EVENING, NOVEMBER 23, 1863. NO. 4.

## A PATENT BLASTING LOCK.

In our last issue we made some notice of a recently invented machine for rock drilling. To-day we present the accompanying illustration of a very useful and ingenious little piece of mechanism which may prove a most useful and appropriate accompaniment to a rock drilling machine, and which, in fact, could be employed in all cases where any considerable amount of blasting is required. This instrument is known as "Hughes' Blasting Lock," and sold by Messrs. Hughes & Co., at No. 408 Commercial street, in this city. In order that its utility may be understood, we give the following description of the mode of using it, which will be clearly understood by carefully reading the same in connection with the illustration.

First cock the instrument by pulling the brass knob represented upon the extreme right of the illustration; then put the water-proof cap on the nipple seen in the opening of the cylinder; next cut off the fuse one inch above the surface of the rock in which the blast has been put, and insert the lock into the projecting fuse so that it will enter the muzzle as far as possible; then raise the lower lever till it stands at a right angle with the cylinder. When ready for use the upper lever, which acts as the trigger must always be down on the cylinder. Care should be taken that the chain connecting the two levers, is not kinked or tangled; if it is so, when you pull the cord it will pull the machine loose before the cap is set. If used in a shaft, the upper end should always be at the top, when all is ready, ascend the shaft, or remove to a place of security in the mine and pull the cord. The machine will at the same instant disengage itself from the fuse, to which it had previously been fastened by the upper lever, and should be promptly pulled out of the shaft away from the vicinity of the blast. The lock should always be kept well oiled and the muzzle cleaned like the barrel of a pistol. A single blast or a series of blasts may thus be set off at the same instant.

The advantages of this machine are immunity from danger, great saving of fuse and time, and a greater certainty of discharge from the employment of a shorter fuse. The lock will only fail if ever fails in its duty. In sinking shafts, where blasting is required, the advantage is very important, as will readily be perceived. The machine weighs but a few ounces, and may be readily forwarded by express or mail wherever it may be desired.

**THE COPPER SPECIMEN.**—A very fine Specimen of Copper from the Eureka Company, Nevada county, may be seen at the Express Building, on Montgomery street. The specimen weighs 226 lbs. and was taken from a shaft at the depth of seventy feet, only.

**PAPER VS. GOLD.**—There are 88 banks in Rhode Island, with a capital of \$21,000,000, on a specie basis of a trifle over half a million.

## Hughes' Blasting Lock.

### LETTER FROM REESE RIVER.

AUSTIN, N. T., Nov. 8th., 1863.

**EDITOR MINING & SCIENTIFIC PRESS:**—The Virginia City *Enterprise*, of the 5th inst., gives currency to some ridiculous street rumors, which are calculated and probably intended to deter capitalists from investing in the Reese River mines, and which doubtless originated from jealousy of a growing rival. These rumors are to the effect that loads of silver ore from the Gould & Curry are being shipped to Reese River for the purpose of "salting" worthless claims, and that a large amount of bullion has been purchased at Gold Hill, brought out here and run into bars, and palmed off as the product of these mines. The first of these rumors, the *Enterprise* thinks, is "absurd," for the reason that the ore from the two regions is as much unlike as coal is from chalk, and no man here could be deceived. The Editor, had he been disposed, might have given several much better reasons for discrediting the story. Without doubt there are many worthless claims in the Reese River District, which the owners would be glad to sell; but were they disposed to "salt" them, they could get plenty of good ore for the purpose in their own neighborhood, without going to the expense and trouble of purchasing it in Virginia and paying ten or fifteen cents a pound freight to Austin. The other rumor, the Virginia paper thinks, is more plausible, but viewed in a proper light it is equally as absurd as the first. Our mills, it is true, are not turning out as much bullion at the present time as had been anticipated by those well acquainted with the richness of our mines, but the article can be readily purchased here at a discount of five and six per cent., and a man would be a simpleton to send to Gold Hill for it, where he would have to pay nearly its assayed value.

A reader of the Virginia City papers cannot fail to have noticed that they never omit an opportunity to make a fling at the Reese River mines, while the mines of Humboldt and Esmeralda, when referred to at all, are spoken of in the most respectful terms. The reason is they have well grounded fears that their far-famed Comstock will soon be eclipsed by the rich silver veins of Reese River, while they have no fears of rivalry, from Humboldt and Esmeralda.

Of the several thousand ledges, located within five or six

miles of Austin, it would be too much to expect that all would pay for working, but if one in a hundred pays, Reese River must shortly become the most important silver-producing country the world has ever known. Working tests have been made of rock from over a hundred ledges, and the yields have certainly exceeded what could have reasonably been expected. Our mill men lack the experience of properly treating the ores, and the mills are not supplied with the requisite machinery for saving the silver, yet with these drawbacks, scarcely an instance has occurred in which the yield was less than a hundred dollars a ton, and the average yield will probably exceed two hundred. This is much

greater, as I am assured by those who know, than the average yield of the Comstock mine. Our mines, it is true, are mostly small, and none of them will compare with the Comstock for size; but there is one advantage of small mines which should not be overlooked—that is, the saving the expense of timber. A ledge of one or two feet in thickness can be safely worked with very little timbering; but to work a ledge the size of the Comstock, in a country like this, where wood is not plenty, the expense of timbering would be enormous.

Having resided here for several months, and carefully examined several hundred mines in this vicinity, and having, withal, had considerable experience in quartz mining, I have no hesitation in predicting, that in one year from now the bullion shipments from Reese River will exceed the present shipments from Virginia City; and I shall be much disappointed if Austin is not, in less than three years, the second city on the Pacific slope. T. H. R.

**THE UNION Gold Mining Company of Klamath Co.,** have recently got their mill into very successful operation. They are running eight stamps with steam power and crushing about 12 tons per day. Their average "clean up" is about \$300 per day, or \$25 per ton—a very good business.

We have received several very rich specimens of ore from the "Illinois" and "Golden Age" mines, Reese River. The Illinois has a shaft thirty feet deep, with a vein five feet wide. The Golden Age has a shaft down 35 feet with a three foot vein, well developed, and regularly increasing with the depth. These companies have determined to prosecute the work of development during the winter months. Both have quite an amount of good ore already out, and each bid fair to soon take a high rank among the rich mines of Reese River. The idea that once obtained credit that the Reese River veins were too small to work, or were not to be depended upon in depth, is now pretty well exploded.

Among the recent scientific agricultural suggestions is one for improving chalky soils by using sulphate of iron as a manure. It is stated that just as a preparation of iron is prescribed to the human subject when the blood is poor, so poor and barren soils may be greatly improved by sulphate of iron.

[From our Travelling Correspondent.]  
CAMPO SECO.

Mr. Editor:—When I started upon my present route of inspection, commencing from the Keystone claim in Copperopolis, up the Salt Spring Valley north to Campo Seco. I thought I could accomplish the whole in three days, and include the result in one letter. I find myself mistaken in both calculations. The mines in this section are so numerous, and far apart, that for the present, I must omit those in the valley and confine myself to those around Campo Seco. By this arrangement I shall save time, and avoid confusion.

It will be unnecessary to say much about the town, as people generally, I presume, are familiar with it. Before the "copper age," Campo Seco, like many other small towns in the interior, which flourished under the "golden age," was falling rapidly into insignificance. During the three years elapsing since I was here, I observe several striking and gratifying improvements. The town looks cosy, and well-to-do; the people are orderly and of a most respectable class. The two hotels, the Hooker and Phoenix, are well kept and comfortable; while the stores, and the appearance of things in general, indicate a new spirit, and that Campo Seco under King Copper, is destined to become quite a place.

And well it may—for the mines so far as developed, are of first-class character. At San Francisco you have no idea of the advanced condition they are in, both as regards the development of the lodes under ground, and the excellence of the works above ground. Their position, however, being over four miles apart, east and west of the town, requires a few preliminary remarks, to make it comprehensible to people at a distance.

Since I reported upon the Gopher District, I have given the country in all directions a more close and thorough examination, and I find each of the three systems already described, contain at least four distinct and separate veins. This fact, though it may sound strange to many, is nevertheless very obvious in the Copperopolis Valley, at the Collyer and Plymouth Rock claims; it is equally so at the Massachusetts Hill, three miles west, and I am satisfied it is the same at Gopher. I had adopted this opinion before I reached Campo Seco; and, here I find the three systems, in character, position, and distance apart, exhibiting themselves precisely the same as they did 20 miles south. If geology in certain respects, "is never at fault," there is no other way than this, of explaining the difficulty and contradiction at once apparent to the investigating mind, if an opinion is to be formed of the probability of general success by the location of each shaft. Many intelligent gentlemen, to whom this contradiction has long been apparent, as it was to myself from the commencement, now admit my theory has the strongest claims to consideration, inasmuch as it ultimately ensures success to all the prospecting going on, which otherwise would be a matter of very doubtful propriety.

I think as far as Campo Seco is concerned, the linear course of each system may be thus safely located. The Copperopolis lodes, strikes the Comeh claim in the valley, go to the Forty nine and Liberty claims, and thence to the John Bull district on the Mokelumne river east of north three miles above the town; the Massachusetts Hill lodes, west of north, one mile and a half below the town—while the Gopher lodes range somewhere about Poverty Bar, and Lancha Plana to Lone City, where I am satisfied they can be struck in the neighborhood of the cemetery. The advantages of this theory, in three respects, are immense; it certainly proves these copper deposits to be one of the greatest wonders in world; it suggests more safe and paying investment for the redundant capital of the State, than all the far off Reese Rivers and Devil's Gates put together: and, if systematically observed, will save the companies, different lodes north and south of Copperopolis, an untold amount of money, labor and time. It is an old axiom, that whenever science gives certainty to labor, it is in that proportion valuable and authoritative. If I am correct in my theory, than the labor going on around Campo Seco, involving thousands of dollars, must be successful; if not, the greater portion of it is a foolish, desperate speculation, conceived in temerity, pursued in temerity, which will bankrupt eventually two-thirds of those interested. I take it for granted, all who understand mining will admit at once, that to comprehend distinctly the system you seek to develop, its locality and linear course, is an immense advantage; because, that knowledge discloses the two

great secrets of successful mining—viz, where to commence, and what to do. Such I hold is the advantage this theory confers; and applying it to the Campo Seco mines, it points only to two undeveloped claims, which in the end will prove failures.

After this explanation, it will no longer seem strange to our readers not thoroughly posted in the mysteries of mining, how a variety of claims, running in parallel lines, four or five miles apart, can all be successful, or expect to be so in the end. I shall now introduce you to the Campo Seco mines, no less important or numerous than those already described. It will be most convenient to commence with those lying west one mile and a half below the town. First, on the banks of the Mokelumne river is the

#### COPPER HILL.

This mine, at present, is one of the two most important in the neighborhood. It is incorporated, containing 3,200 feet, divided into 3,200 shares. The main shaft is 280 feet deep with four shafts. A large quantity of valuable ore has been shipped from this mine, though the yield is not so great just now, simply because the black ore is changing into the yellow sulphurets. In fact I got a piece of rock off the bottom, which it was impossible to tell from the Massachusetts, on which system I locate the se mines. If this lead opens here, as it has at Copperopolis, of which I have no doubt, high as Copper Hill stands, in will more than double its value. All the work at this mine are excellent. A large water-power wheel forty feet in diameter is being put up, which will be a great improvement. Fifteen hands are employed day and night. No stock in the market. A short distance south on the same lead comes the

#### CAMPO SECO.

This mine is the compeer of Copper Hill. It contains 2,600 feet, divided into 200 shares. The main shaft is 100 feet deep, six feet in the clear, exceedingly well put together, from which a drift runs east 70 feet. Out of this I took the beautiful specimen of blue ore I send for your cabinet; the other, (black) perhaps richer, comes from the bottom of the shaft, where like the Copper Hill, the vein I think, is giving way to the main lode of yellow sulphurets. This mine has also yielded a very large quantity of these rich colored ores, and will continue to yield them in large quantities for years to come. The drift is a splendid piece of work, and does the Superintendent much credit. The mine is worked by water-power, the wheel being 40 feet in diameter. All the upper works are very complete and efficient. The sorting-shed is sixty by thirty feet, from which a track 410 feet long runs to the shaft. The only thing wanting is a pump, and that they are preparing to put down. It is much needed below. A number of hands are also employed here night and day. The Campo Seco stock ranks high, and deservedly so, for it fully merits its reputation. It will take another year, however, to develop its real value. Next in succession, but on another vein comes the

#### LONE STAR.

This claim contains 1,500 feet, divided into 1,500 shares, being incorporated. The main shaft is 95 feet, but, at present, the lead though very large, is equally corrupt, bearing antimony, iron, and arseniates, as well as copper. Still the indications are flattering. The prevailing error of sinking the shaft too far west has been committed here, and, they have consequently to run a long drift through very hard rock to cut the vein, and then the old tale, a new shaft, will be needed. Nevertheless, the mine ultimately must be valuable. On the Lone Star, as throughout all this section, the croppings are splendid. On the other side of a small creek, and directly opposite, is the

#### LANCHA PLANA.

This claim is incorporated, and contains 3,200 feet, divided into 3,200 shrs. Main shaft 164 feet, from which runs a short drift to the west. The Lancha Plana enjoys a very high local reputation. I could not go to the bottom of the shaft, as the men were timbering, so I did not see the vein, which I understand is very fine and large. I regret this as I was anxious to see what resemblance it bore in formation and character to the Massachusetts. The Lancha Plana has yielded large quantities of first class ore. At present the Company are preparing to put up an engine of twenty-horse power, which when completed is expected to develop great things a few minutes walk south from the Lancha Plana brought me to the

#### HIGBEE.

This claim has 2,400 feet, divided into 2,400 shares.

Main shaft 65 deep. The Higbee is not on the same lead as the Lancha Plana and Lone Star, but that of the Campo Seco and Copper Hill. Work is suspended here for a time, to erect machinery for hoisting, and as the shaft was full of water, I could not, of course go down. Undeveloped, however, as the mine is, the stock has a local value quite respectable. I understand the lead opens very handsomely strong sulphurets following the tale down all the way. Next the Higbee on the same vein is the

#### HAWES & CO.

This claim contains 1,200 feet, divided into six shares. Main shaft 85 feet. Like the Higbee, this vein opens very handsomely, carrying all the elements and indications of large strong lode. All it needs is depth. Work going steadily. Last on this side of the town, that I could hear of, meriting notice is the

#### OMAHA.

This claim contains 1,400 feet, divided into 1,400 shares. Main shaft 75 feet. Work is suspended here, for the present, to prepare machinery for hoisting. When resumed, the company intend running a drift to the west. The ledge is very strongly developed and very promising.

I must now return to the town, and proceed somewhat miles in an opposite direction to John Bull district. The mines in this section are unquestionably on the "Union lead," and with one exception, are all exceedingly promising. The country is hilly, barren, torn up, rough, bearing a strong mineral aspect. The lodes here on the surface are well developed. I shall commence at the river. Immediately on the banks is the

#### NORTH STAR.

This claim contains 1,400 feet, divided into seven shares. Main shaft sixty feet, somewhat small, but very well timbered. The vein shows itself beautifully. I think the copper will be struck first in this mine, owing to its favorable location. Next in rotation, is the original claim of the district the

#### EUREKA.

It contains 2,000 feet, divided into ten shares—incorporated. Main shaft, 140 feet. At the bottom, the vein rapidly concentrating, with a very handsome hanging wall. The work in this shaft is well done, and neat throughout. The accommodations are good. There are about forty tons of No. 2 ore on hand, which will be largely increased before Spring. The Eureka is a fine institution and well conducted. Next comes the

#### BAY STATE.

This claim contains 3,200 feet, divided into 3,200 shares. Main shaft 84 feet, with the vein opening on the bottom. Like the Eureka, the work here reflects credit on the Superintendent, only the ladder is too long in the steps for a man with short legs. According to appearances at present twenty or thirty feet more, ought to strike good ore. The rock is very pure all the way down. Accommodations good. Since writing the above, magnificent ore has been struck in this claim.

#### BUNKER HILL.

In my opinion, this shaft is altogether wrong in its location and shows few or no indications of a vein. The drift at bottom running east is still worse. They should prospect the opposite hill to the west. Behind this claim a short distance east, comes the

#### WINFIELD SCOTT.

This claim contains 6,400 feet, divided into thirty shares. Main shaft is down thirty feet, just commenced a splendid opening, and a strongly developed lead.

#### SEBASTOPOL.

It contains 4,000 feet, divided into twenty shares. Main shaft thirty feet, a counterpart of the Winfield Scott, with equally favorable prospects of success.

#### SPRING RANCH.

It contains 6,200 feet, divided into thirty-one shares. Main shaft fifty feet, carrying from the start a well defined ledge. It has now a splendid hanging wall, and may certainly be considered an established fact. Some 300 feet from this claim lies the

#### MORNING STAR.

It contains 6,000 feet, divided into thirty shares. Just commenced under equally favorable auspices. Last in this section comes the

#### MOUNT VERNON.

It contains 3,000 feet, divided into 3,000 shares. Main shaft fifty-three feet, in which they have struck a small vein.

of good ore. Work being suspended for a time. I did not go below.

Such are the claims around Campo Saco. I am very favorably impressed with their character. Taken generally they are more advanced, and look better than in any other section have hitherto been. When the sixteen mines get into full operation, what a change they will produce. I have been very cordially received here by all classes. To Mr. Brown of Copper Hill, Mr. Spencer of the Campo Saco, Mr. Baldwin of the Eureka, Mr. Sparkes of the Bay State, Mr. Higbee, Mr. Lawes, and Mr. Coleman, I beg to acknowledge my obligations personally. They have too liberally patronized the Press. Most ardently do I wish them long lives to enjoy the fruits of the success before them. L. H.

**G. E. MOORE,**  
Assayer and Analytical Chemist,  
No. 612 Sacramento Street,  
HAVING ESTABLISHED A CHEMICAL LABORATORY,  
furnished with every requisite for delicate analytical work, is prepared to execute the Assay and Analysis of Ores, Mineral Waters, Guanos, etc., with accuracy and dispatch.

quired to become a practical Assayer.

**AGENTS WANTED.**  
We want a good Agent in every city, town and settle-  
ment, on this Coast. Applicants will send their names  
with reference, when specimen numbers of the **Min-  
ing & Scientific Press** will be forwarded to them,  
and their names added to our published List of Agents.  
EWER & SMITH.

WM. H. MEAD, THEODORE VAN TASSEL.  
**MEAD & VAN TASSEL,**  
**HATTERS,**  
Montgomery st., cor. of Commercial,  
SAN FRANCISCO.

TO OUR FRIENDS AND THE PUBLIC GENERALLY.  
Having Purchased the entire interest of Messrs.  
Sather & Co. in this city, we shall, on the 1st day of  
July assume the management of the  
**HAT EMPORIUM,**  
long conducted by that firm.

Mr. WILLIAM H. MEAD, for the last seven years Sales-  
man with Messrs. Fisher & Co., respectfully solicits a con-  
tinuance of the patronage so long and liberally bestowed  
on the old House, feeling entire confidence in our ability  
to suit in every particular.  
Mr. THEODORE VAN TASSELL, for eight years with  
Messrs. Le Gay & Co., would be pleased to see his friends  
at his new place of business.  
The long practical experience of Messrs. Mead & Van  
Tassel in the Trade justifies them in saying that their  
work cannot be excelled either in finish or durability.  
Having perfected arrangements, we shall be in constant  
receipt, by every steamer of soft goods of the very finest  
French and American Manufacture.  
Our Stock now on hand is superb.  
Call and examine, and judge of the merits of our claim  
to the title of "LEADERS OF FASHION."  
Respectfully,  
**MEAD & VAN TASSELL.**  
Montgomery street, cor. Commercial.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

### METHOD OF CRUSHING ORE.

The BRYAN BATTERY, as now constructed, is believed  
to combine all the Improvements which the experience  
of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1850, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.

## MINING & SCIENTIFIC PRESS. THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

### The Inventor!

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patents  
with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

### The Mining Interest!

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Min-  
ing Stocks, new inventions of Machinery adapted to that  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

### To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of infor-  
mation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

### Terms.

To mail subscribers:—Four Dollars per annum]  
**Club Rates.**  
Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Names can be sent in at different times and from  
different Post-offices. Specimen copies will be sent  
gratis to any part of the country.

**PRACTICAL ACCOUNTANT,**  
305 Montgomery Street, Corner of Pine.  
**TO QUARTZ MINERS.**

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centro and passes under it, between the grinding sur-  
faces, to the circumference: from whence it passes again  
over the muller to the centre, through the holes and be-  
tween the grinding surface to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Whoeley's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the parties infringing. My Amalga-  
mators can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.  
sep21 THOMAS VARNEY.

## Mining Notabilia—Extracts from Correspondence, etc.

## THE COMSTOCK LEAD.

From Virginia City and vicinity, we continue to hear most favorable accounts. The Ophir is still taking very rich ore from the spur or lead developed by the recent "cave."

The Central, No. 1, are down 400 feet, perpendicular, where they have a fine lead developed. The California, next adjoining on the south, are down about 300 feet, where they have a fine vein of ore. The Company have recently put up a very fine house upon their mine, with all necessary conveniences for actual operations.

The Central No. 2, are still driving ahead their branch from the main Latrobe Tunnel, which is to strike and develop their ground to the depth of nearly 500 feet. They have now a little over 100 feet to run, through very favorable ground. Much anxiety is felt by all Comstock owners, in this vicinity to see this important tunnel reach the Comstock Lead, which it will fit do on the Central No. 2 ground, and within sixty or ninety days.

The owners of the Kenney ground (70 feet) are doing nothing, but waiting for developments by their neighbors. The White and Murphy company, who own 210 feet are actively engaged in clearing off their ground preparatory for the erection of house, machinery, etc. During the present season they will put up their house, and a "whim," and commence a shaft, which will be four by twelve feet. In the Spring they will put up heavy machinery, and push on as speedily as possible to a full development of their mine.

The Dick Sides, next adjoining, Company are now down 200 feet with their main shaft, which is covered with a substantial house. They have their machinery on the ground, which will soon be up and running.

The Best & Belcher are keeping space with their next neighbor, just noticed; both are going to work on the right basis, for properly opening their mines.

Next in order of succession comes the Gould & Curry. This mine is too well known to need any particular notice in such a sketch as this. The deeper they go in this mine, the richer the ore appears to be. In their lower gallery, the ore surpasses anything yet found in that famous claim, both in quality and quantity.

The Savage, next adjoining, are still taking out very rich ore, and plenty of it. This is one of the first class mines.

Our correspondent confesses to not being particularly posted as to the Hale & Norcross, but believes it to be a good mine.

The Chollar has the best works on the Comstock, and our correspondent thinks that it will soon be second to none in the Territory. The Company is now taking out considerable ore which is paying well—about \$50 to the ton. They are now supplying four mills, and will soon be in condition to keep a dozen at work. Our correspondent saw a few days since at an assay office, "bricks" to the amount of 200 lbs of bullion, worth \$5,500, the result of 100 tons of ore which had just been put through the mills.

The Potosi Company are taking out some very good ore from the north end of their claim, but at the south extremity, where they recently erected a small engine, they have shut down, evidently pretty well satisfied that there is nothing south of the Chollar line, at that point. This Company are now opening their third gallery at the depth of 310 feet. The ore which they are at present taking out, comes from the first gallery at a depth of 180 feet. Very superior ore was struck on the 14th. inst., near their engine shaft in the second gallery. This mine is under the management of Mr. De Land, and the manner in which work is now being prosecuted, and the substantial character of its machinery, reflects the highest credit on his energy and skill as a Mining Superintendent.

"420," a name by which the next adjoining ground is known, have let a contract to sink a shaft 150 feet—4 by 12—for \$22 per foot, the contractors furnishing everything. The claims situated south of this point, are embraced within the Gold Hill district, of which we shall defer mention until another time.

AUSTIN, NOV. 14TH., 1863.

MR. EDITOR:—The Miners of this district, subject to a call made through our local paper, met on the 11th. inst., and decided that the mines should not be laid over, by a unanimous vote. After which a resolution was passed requesting that this decision should be communicated to the most important papers in this Territory and the State of

California; among which I find the name of your valuable paper, and I may as well say here, your enterprising journal, by its steady, and devoted efforts in behalf of the mining interests in general has given it no small significance among the miners of this district.

What would have been the position of our mines, had this movement on the part of some few drones who would like to spend the winter in more congenial quarters, and hold on more feet than they could work, is too suggestive to be misunderstood. The fate of Humboldt with all its native wealth, stands spectre-like before our vision, and warns us of our danger. We will improve by it.

In regard to this place, such has been the rush of enterprising tradesmen with a large stock of goods of every kind, that they now stand at their doors, if they are so fortunate as to have any, like a skipper on the quarter-deck, whistling for a breeze. [Customer?]

Mechanics as a general thing, have had the best time of it. They have had lucrative and constant employment. Medical men have poured in by scores, proffering their services, offering balm and consolation to the sick and dying—for a consideration. If the spark of human kindness predominates; it proves a dangerous experiment, for ten chances to one, his labor goes unrewarded and he must besides purchase his own medicines or see his patients fade like the leaves in Autumn. By a combination of the druggists, the price of drugs is the greatest burden we have to complain of.

No one living away can possibly know the amount of sickness in our midst. The cold weather is now upon us, and hundreds are unprepared to meet the storms and must be exposed, endangering their health and multiplying the objects of charity, already alarming.

If this is plain talk, it is the truth, nevertheless, and as a correspondent of your candid journal, I am, I trust, but carrying out your injunctions when you enjoined upon me to write nothing but the truth and the whole truth. Such has been the demand on public charity, that our county commissioners have resolved on opening a hospital at the earliest date, and when it portals are opened, the rush will be beyond its capacity. Many do not like this liberality on the part of our commissioners. It will multiply their taxes, forsooth! I will ask, what shall we do? Shall we hoard up our treasures, gather in our harvest, and say we have no interest in our fellowmen? God forbid! We have men of hearts, as well as nerve, and we will help the afflicted, and look to an approving conscience for the reward. To such men as Judge

—, a gentleman well known in California, are we indebted for this act of public benevolence. May Heaven ever smile with approbation on his big heart, is the prayer of many noble souls, now restored to health, who are too full of gratitude to express their thanks for his untiring, indomitable efforts in their behalf. Did I not know of his many acts of kindness I might say less. Should this communication ever meet his eye and afford him pleasure, let him understand, I am not done with him yet, and the whole people will cry Amen.

In my next I will treat of the mines in this neighborhood, and the extent of their development. Some valuable discoveries have been made quite recently. One called Amador, in the Yankee Blade District, has created a great excitement. I have seen some of the rock and it certainly looks like the best in this district. I shall make it a visit, and will give you the result.

"V.D.L."

## THE NEWTON COPPER MINE.

The Newton is ranked as one of the leading copper mines in the State, perhaps second only to the Union. The Proprietors were offered \$250,000 for the mine some six months since, with a condition; \$250,000, without conditions would have taken the mine at that time. A much larger amount of coin at the present time, however would fail to take it. This mine was first opened about one year since. The first shipment of ore was made in January last. Since that time 1000 tons of ore have been shipped; having been disposed of at highly remunerative prices; \$23,000 was received from one party in this city. Until recently all the ore raised from the mine has been sold without sorting. The better plan of assorting the ore has now been adopted, and it is now divided into Nos. 1 and 2.

The mine has been opened by two shafts, one of which, is 130 feet deep, and another 250 feet distant, is 70 feet deep.

From the first shaft a drift has been run 200 feet north and 60 south. The second shaft is still going down. The shafts are all on the lead. Some idea may be obtained of the strength of the same from the fact that all the ore yet raised about 1,200 tons, has been taken from these shafts and drifts; stooping has not yet commenced. The mine has paid expenses from the beginning. No assessment have ever been levied upon it, and probably none ever will be. It is the intention of the proprietors to thoroughly open the mine in such a manner, that whenever the proper facilities for transportation are presented they can put a large force at work, and raise several hundred tons of ore per month. A present these facilities of transportation are confined to return teams, all of which are loaded as fast as they present themselves at the mine. A railroad has already been projected from Stockton to strike the Pacific or Folsom road some point above Sacramento. This road will pass within about 12 miles of the Newton mine, and it is expected that by another year the mines of that region will develop sufficient business to warrant the construction of a branch to Ion City. The mines of that region will not be thoroughly developed until railroad facilities are opened up for taking the ore to market.

There are no croppings on either the first north or south extension of the Newton mine. Croppings which present themselves are on the second extension only—our note are at fault whether north or south. We are indebted for the above particulars to Mr. J. Newton, one of the proprietors and brother of the Doctor, with whose name the mine has been more particularly associated. The mine contains 1,800 feet, divided into nine shares of 200 feet each.

## MORE UPON CADMIUM FLUXES.

A publication of the hour revives the idea that a valuable discovery has really been made in Contra Costa County, Sacramento Street was once made to divide the honor, but this claim is pronounced "wild cat." There never was any cadmium. There is nothing but a natural combination. The proprietors of the land must get all the ore is worth as a flux or whatnot. No one may share with them—no one else may get anything for discovering (pshaw!) that a natural combination has a greater value than a simple mixture. Its application is not patentable. (?) Is not this the argument of the monopolists? We think we do not mistake it. Thanks to the present discussion, we learn that the Contra Costa material occurs "under the many forms—of an earth enclosing crystals of macle—of a lamellar mass breaking into leaves like slaty lastly of a hard dark green rock." Among its many forms five different men have, at least, found one which contains cadmium. This is of no other value, perhaps, than shown that at present the subject is not exhausted. We are to, by every learned compiler that it may be compared with the argillaceous schist of the Lower Hartz, but that the multiplicity of its bases, renders this silicate as superior to the schist, Newcastle to Mont Diablo. The multiplicity of bases foribly reminds us of the six days fight which resulted in change of base. Is it at last come to this that the value of this cadmium flux is only to add fusibility? We do not deny that this is of value—but so is a nickel cent if not in California—it has not the true ring, we do not see the color. More than increased fusibility and much more is required to constitute "a very effective flux by the aid of which the different combinations of copper and other metals can be reduced. It is "a silicate with many bases" but slags formed with it (?) have been seen by us which indicate that it has a sufficient excess of silica to absorb much iron. Is it then acid or basic, must we mix it with sand or iron? Some of the same slags appear to contain a proportion of copper so large that their peculiar "fusibility" does not seem of much advantage—this may have been only due to defective manipulation—is this a correct assumption? These several points are still undecided. The proprietors of the land, if they are to be the only parties to have an interest in this claim, may well be at the expense of definite examination.

EELS IN CANALS.—The well-known French author, Edmund About, has proposed that the French Government shall stock all the canals in France with eels, both as a source of revenue to be raised on grants of the right to fish, and of a cheap and wholesome food for the poorer classes of the people.

**FINE SPECIMEN OF SILVER ORE.**—A fine specimen Mexican silver ore, may be seen at the door of Faulkner & Son, 411 Clay street, weighing about 400 pounds and assaying \$300 to the ton. The specimen is from a large mass, thrown off from the vein at a single blast. The Company has about 100 tons of similar ore at the mouth of their mine, ready for shipment, with plenty more of the same sort to raise. Three distinct veins pass through the Company's ground, which will average about six and one-half feet thick, separated by about 50 feet of unproductive rock, resembling iron ore. The San Antonio District is one of the most promising in Mexico, and is fast filling up with American adventurers.

**TABOR & HILL, Real Estate Agents and Stock Brokers,** place their card in our columns to-day. Messrs T. & H. are members of the S. F. Stock & Exchange Board and San Francisco Board of Brokers. Any business entrusted to their hands will be promptly and faithfully attended to. They may be found at 402 Montgomery street.

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

### Giffards Injectors,

### WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. **no16-tf** **ZENAS WHEELER.**

**N. B.** All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms. Jy 29

**PUMPS!** **HARRISON'S** California Lift and Force Pump, WITHOUT VALVES OR PACKING, Suitable for Mines, Fire Engines, Wrecking or Irrigating. This is the Cheapest, Lightest and most Durable, and least liable to get out of order, of any Pump yet invented.

**ALL SIZES;** Capable of throwing from ONE HUNDRED to FIVE THOUSAND Gallons per Minute—For sale by **C. H. HARRISON,** PHOENIX OIL WORKS, je-15 517 Front Street, San Francisco.

**60 lbs. MARINE and Fire-Proof Paint,** MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Bulk and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:** For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil. For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot. For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.** When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:** HOUSE—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead. ROOF—Five parts of Mineral Paint, one part white Lead, mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years. **S. C. BRADSHAW, Agt.,** G. T. FOUQUE, Superintendent. **WORKS, North Beach; Office, 509 Sacramento st., San Francisco.**

**Eye, Ear and Throat.** **DR. DE CASTRO,** Oculist and Aurist,

**WHO HAS PRACTISED IN NEW** York and all the principal cities of Europe with such unrivalled success, and from each place is in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. Deafness of long standing thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**Self-adjusting Artificial Tympanum,** For the relief of deafness, attended by loss or injury of the membrana tympani, and for the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November, 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery. Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state: the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

**Mr. Editor.**—Having been afflicted with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent one operation and it is with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist. **JOHN REESE, Napa Valley**

**James Callaghan, witness,** San Francisco, July 30th, 1863.

[From the Daily Alta.] **San Francisco, June 30th, 1863**

**Dr. De Castro's** through your widely circulated journal, to say, that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearny and Market Streets, and undergoing under his direction, two operations, she has heard sound very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physicians and aurists in California, but up to the period of visiting Dr. De Castro, received no benefit. **CHAS JOHN P. WRIGHT,** 812 Green Street.

**HEPBURN & PETERSON'S**

**AMALGAMATOR.**

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

**GOLD AND SILVER ORES,**

manufactured and exhibited at the Valcan Iron Works, Nos 137 and 139 First Street, San Francisco.

These machines secure to the miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machines now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Yehyir Flat Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

EWER & SMITH,  
PROPRIETORS.

VOL. VII. SAN FRANCISCO, MONDAY EVENING, NOVEMBER 30, 1863. NO. 5.

ROUND VALLEY, Nov. 22d, 1863.

MINING AND SCIENTIFIC PRESS: 'Tis not often I write, in fact, I make a poor fist at it—but, with your permission, I will make my grand *debut* in "Bay Circles," as my returned, unsophisticated friend said the other day. I write for three reasons: because this region, so little vaunted, at least deserves notice; because the printer wants copy, and because it is meet that we occasionally throw a few rays of California true light, in the paths of those blinded by Boise, Reese or other distempers. True, these places may be rich, but have we not as good country at our own doors? However, it is idle to reason with those afflicted with the "fever," or "distance lends enchantment to the view."

In these grand old hills, that stretch from the Columbia to the Colorado, and from the Pacific to the Great Basin, slumber countless thousands of veins of gold, and silver and copper, that time and willing hands will yet reveal. You need not go to the far-off Frazer, nor to the wintry heads of the Columbia; nor to the burning deserts of the Great Basin, to find them; but here, on 'Fornia's bounteous soil, is a field so vastly extended, that the yet unborn, will reap fabulous fortunes from their own discoveries.

Fearing that this strain will not suit the "practical," I will turn to local affairs.

Round Valley, from which I write, is situated near the edge of Plumas county, and is of but little consequence as a valley; what little notoriety it does possess, is derived from the numerous gold-bearing quartz ledges in its vicinity. As facilities for working, this country is unsurpassed; timber of every variety and in the greatest profusion, abounds on every hill—and lying spread in full view of every ledge, is Indian Valley, embracing fifty thousand acres of as fine agricultural land as there is in the State.

The Ellis Ledge is the pioneer ledge, nine hundred feet of which is owned by the Round Valley Quartz Mining Company, who have two fine quartz mills in operation, one with twelve and the other with sixteen stamps. They are said to be "doing well;" a proof that "there is something in it," is that the mills have been operating successfully for nearly two years. They have excavated to the depth of two hundred and fifty feet.

The ledge of first importance, however, is the Blood ledge, owned by Bolinger & Co., who have a twenty-four stamp mill in full operation; it is yielding most handsomely; it does not only good to see the glitt ring bullion every clean up.

Next comes the Waterworth ledge, at Granville, two miles distant, which is truly a master ledge, and when worked with ample machinery, I believe will be equal to the best. Waterworth & Co. originally owned the whole of the ledge, but sold one-half to Messrs. Blood & Harvey, who incorporated under the name of the "Indian Valley Quartz Mining Co." In addition to those named there are four other quartz mills in operation, and all of them seem to be doing something. Gold is not all we find in this region; copper is also found in abundance. The Superior Ledge, owned by Major Bidwell & Co., situated a short distance from here, promises to yield with Copperopolis; also the Genessee Valley Gold and Copper leads are ranked among the best.

Space will not allow me to particularize, but in future I contemplate giving you a geographical view of the country here, as also a minute description of the working and appearance of the several mines, adding any further facts that may present themselves.

BENEDICT.

AUSTIN, N. T., Nov. 20, 1863.

MR. EDITOR: I have now been in this mineral kingdom about ten days, but have not yet availed myself of any opportunity to visit the reported good ledges in this vicinity. We have had some little snow and rain, but all is fair again, and the ground is almost destitute of any snow, and all is lively in the haste to get our winter shelters completed. I bought lumber to build me a small house, but speculation claimed too much for a building lot; therefore I piled up my lumber and hired me a room until I can satisfy myself about which is to be the great city of Lander county, and whether the mines will warrant half the expectations placed in them.

There seems to be four or five mills pretty nearly ready to run, and some of them doing now a smashing business. I noticed this morning our second saw mill in operation, cutting from our short nut pines, good framing timbers and roof lathings, much cheaper than buying them at \$400 per m. ft. I meet with none who do not seem to have the fullest assurance that this is a great mineral section, and that the next season will prove a harvest of much wealth. When we look at the investments being made by mill and mercantile companies, it argues strongly for their confidence. I will endeavor to give you my impressions of mines, &c., here, very soon—just at present I am very busy roofing a large building, and this contract completed, I will expect to take notes on the hill side.

Yours, truly,

B. W. C.

MERCURIAL VAPORS.—A writer for *Harper's Magazine*, in giving a history of the celebrated Almaden mine, gives the following description of the deleterious vapors arising from the works:

"One of the most curious circumstances connected with the New Almaden mine is the effect produced by the mercurial vapors upon the surrounding vegetation. Despite the lofty chimneys, and the close attention that has been devoted to the secret of effectually condensing the volatile matter, its escape from the chimneys withers all green things around. Every tree on the mountain side above the work is dead, and some of more sensitive natures further removed exhibit the influence of the poison in the shaken and blanched foliage; but these effects do not extend to any great distance. Cattle feeding within half a mile of the hacienda, sicken and become salivated; and the use of the waters of a spring rising near the works, is guarded against. It does not, however, affect a mineral spring near by, which possesses the peculiar qualities of soda or Congress water. The workmen at the furnaces are particularly subjected to poisonous fumes. These men are only able to work one week out of four, when they are changed to some other employment, and others take their places for a week. Pale, cadaverous faces and leaden eyes are the consequences of even these short spells; and any length of time continued at this labor effectually shortens life, and impregnates the system with mercury.

In "Reid's Handbook to Newcastle," the particulars are given of the raw material consumed per annum in the alkali works of the kingdom:—salt, 255,600 tons; coal, 951,000 tons; brimstone and chalk, 380,500; pyrites, 264,000; nitrate of soda, 6,300; manganese, 3,300; timber for casks, 3,300; total, 1,834,000 tons. "Nearly one-half of these materials are worked up in the neighborhood of Newcastle. The salt employed is almost exclusively the produce of the Cheshire mines; but at the Felling works rock salt from Ireland is dissolved and boiled down by waste heat from coke ovens.

INGENIOUS CALIFORNIA INVENTION.—Mr. J. S. Henning, of this city has made application for a patent for an ingenious invention of a machine or contrivance for recording music as it is played upon an instrument. The principle of this invention will not be made public until the patent is secured. The prime agent, is electricity, produced by a novel method, differing from a galvanic battery heretofore known. Mr. Henning was also the originator of a self-reporting telegraph instrument, patented by Amos Kendall, and is the party who proposes to build a telegraph fire-alarm in this city during the present year, if the City Fathers so direct. Mr. H. has devoted much attention to the study of electricity, especially in regard to its application to economic purposes.

"A SUBSCRIBER," writing from Diamond Springs, is anxious that our "Traveling Correspondent" should visit the mines of El Dorado county, and report upon them, as he is now doing upon those of Calaveras. It is our intention to keep one correspondent constantly in the field, whenever the roads are in proper condition for convenient travel. We fully agree with "A Subscriber" as to the importance of such a course, and trust he may soon have the pleasure of a call from the correspondent of the PRESS.

LARGE SALES OF MINING GROUND.—L. A. Booth and Gross & Lombard, have lately sold to the Eclipse Mining Company, ten feet of ground in what is called "Gold Hill proper," for the sum of \$55,000. This ground, though steadily worked for the past three years, now shows more ore than ever.

It is reported that the Washington District, which lies about forty miles to the south of Austin, Reese River, is proving rich and extensive.

THE OLDEST ROSE BUSH, in the world is supposed to be at Hildesheim, in Hanover. It was planted in the ninth century by Louis the Pious, and in 1078 Bishop Hezilo had a wall built around the tree to protect it. It has lately put forth new shoots from the old roots, one of which is twelve feet high and nearly an inch in diameter.

THE STOKTON *Independent* thinks that in two years Washoe will contain 200,000 people, and be dependent on California for breadstuffs.

LETTER FROM ESMERALDA.—We would call particular attention to a very excellent letter from Esmeralda, which will be found upon our second page.

## ESMERALDA.

The mining district known as Esmeralda is situated mainly in the county of the same name in Nevada Territory but running over the line, separating the Territory from the State, into Momo County, California. Aurora, the municipal town in the district, is nearly due east from San Francisco, a distance of 250 miles. By the Route mainly traveled heretofore, *via* Sacramento, Placerville and Genoa, the distance is 380 miles. A good wagon road, however, is being constructed across the mountains from Sonora, Tuolumne County, which was within two weeks of completion when the snows prevented the further prosecution of the work until Spring. When this road is completed Aurora will be *within two days of San Francisco*, by steamboat and stage. The geographical position of Aurora is favorable for growth, independently of its mineral resources. It is in a direct line from San Francisco to Austin, Reese River District, shortening the distance about 200 miles. The Sonora road completed, supplies for Reese River, Excelsior, Silver Mountain, Monitor District and Owen's River will naturally find their destination through Aurora, that being the nearest and best route to all the places named.

## CLIMATE.

Much misapprehension seems to exist in relation to the climate of Esmeralda. That there is much sickness and many deaths occur for the population is true, but most of the instances of mortality are traceable to other causes than the unhealthiness of the climate. With the same conveniences and care the climate will probably prove as healthy as that of San Francisco. Substantial improvements, adapted to the climate, are constantly being made, and with these there can be little doubt but that the health of the district will improve, which even now will not suffer in comparison with any other one east of the mountains.

## AS A MINING DISTRICT,

Esmeralda is regarded by many as under a cloud, and the earnest enquiry is repeatedly made; "Do you think the mines will ever be successful?" or "Is the story of the uncouth wealth of Esmeralda only a golden dream, destined to disappoint all who have cherished the hope of remuneration for their toils and sacrifices?" These enquiries indicate a want of information in reference to the work already performed and its encouraging results, notwithstanding the numerous disadvantages which the district has suffered. The discovery of gold and silver bearing quartz here was made by a few adventurers some four years ago. Pitching their tents in a gulch half a mile south-east of the present city of Aurora, their attention was attracted by the heavy quartz croppings on the sides of Silver and Middle hills. The discoverers are said to have been without capital and could only stake out their claims and wait for something to turn up. They were more than a hundred miles from any settlement, the geography of the country was little known, they had no supplies, no roads, and the surrounding country presented only a grand desolation, whose hills and gulches had never echoed to the voice of the white man. The report which these discoverers made soon attracted a large number of the same class, so that before any considerable capital was enlisted a large proportion of the best ledges had been appropriated by men who had not the capital, if they had the energy to develop them. This fact accounts for the comparatively slow progress, made in mining operations in the district.

## THE QUARTZ MILL.

Another occasion of delay and disappointment arose from the class of mills at first erected. However much expense and time these projectors may have devoted to them they were utterly inadequate for crushing the rock and separating the metals. Some four or five of the primitive structures still stand, as silent monuments of the folly of attempting to force the bullion from the rock, however rich, without proper appliances.

There are now seven mills in the district, capable of doing satisfactory work, embracing an aggregate of 86 stamps, only six more than the Gould & Curry are now running. These mills are all busy, night and day, nearly all of them on two claims—the Pond and Real Del Monte—the only ones in the district fully opened; the latter producing \$100,000 per month. The whole amount, from all the mills, falls a little short of \$200,000 per month. Three additional mills are in process of erection—the Real del Monte is nearly or quite ready for operation, having a battery of 30 stamps, and in al-

its appointments equal to any mill east of the mountains. The Antelope, with twenty stamps nearly completed, and the Durand, just commenced. All three are to be first class mills.

## WILD CAT SPECULATIONS.

Another serious drawback upon the development of Esmeralda Mining District, was occasioned by the graceless wild cat speculations of last winter. It seems difficult to decide whether to be amused or indignant at this phenomenon called "*Wild Cat*." The sellers were not honest or the buyers were not shrewd. If it were allowable to manage a little, it perhaps might be said that the declaration that they who *will* be rich fall into a snare, was exemplified in both buyer and seller; the latter being snared by the temptation to dishonesty and the former into loss by his credulity. But cats, whether wild or tame, like dogs, must have their day, and the wild-cat speculation has risen, flourished and declined, leaving the seller with the reputation of having lost his conscience and the buyer with the consciousness of having parted with his money without receiving an equivalent in value.

## GOOD FROM EVIL.

But it is said there is no unmixed evil in the world, and so it seems likely to prove in this case.

The decline in stocks has induced holders to develop their ledges. That Esmeralda Mining stock will come up at no distant day may be regarded as mainly certain. But they will rise on their own merits. The time and rate of advance will depend on the labor and capital devoted to taking out and working the rock.

## THE ROCK IS RICH.

Fifty-two consecutive assays taken from the books of Van Night & Winchester's assay office, the record of assays made from rock taken from the different claims in Esmeralda district during this year, show an average of \$445 per ton. This, of course, was most of it fair selected rock, and cannot be regarded as a fair estimate of the product of unassorted rock. But the lowest estimate we have heard of, the product of the rock crushed during the last six months is \$75 per ton, and a large proportion of it has exceeded \$100. One company, the Pocasset, before its consolidation with the Crocket, was offered \$110 per ton for their rock, at the mine, but declined the offer. The Pond, the Real del Monte, the Antelope, the Utah, the Chemung Tunnel, Durand, Brewster, Middle Hill Tunnel, Manita and numerous other claims, so far as developed, are equally promising and will in due time blow their own trumpet.

But, the inquiry is repeated, "If the Esmeralda mines are so rich, why do we not receive the bullion?" Well, sure enough. Why? For the same reason that the Feather River does not furnish any water for the bay of San Francisco. All its resources are emptied into the Sacramento, and that river receives all the credit. Esmeralda bullion falls into the Washoe current at Genoa and comes down as bullion from Washoe.

But what about the Wide West? Honestly we cannot tell. It is apparently a great swindle or a great fizzle; and yet, from all the facts accessible to an outsider, a Philadelphia lawyer could not decide which it is, or whether either. The story goes that in shifting Superintendents and hands the original Johnson ledge, from which their rich ore was obtained, was lost and though they have looked for it with lighted candles, for many weary months, no trace of it is visible. So to pay expenses the magnificent mill is crushing Del Monte rock, and the company are still hopefully searching for the lost treasure. It is to be hoped that the search will be more successful than the one made in the Polar regions for Sir John Franklin, though some cherish the belief that the game is to "freeze out," and others, that the whole thing is effectually frozen up as the distinguished northern adventurer himself.

J. B. SAXTON.

**A LOYAL AND USEFUL CITIZEN.**—Mr. T. C. McCaffrey, of Knoxville, Tenn., served three months under General Jackson, thirty-two months in the Mexican war, twelve months in the present war, and has sent *eleven sons* to the Union army, four of whom were killed before Vicksburg.

**IRON-CLADS.**—There are *thirty* iron-clads now in the course of construction from the plans of Ericsson. There are in addition to these, a large number of different construction, now upon the stocks or just launched.

"The American Tea Company" was chartered by the Legislature of Pennsylvania, it having been represented by the tea-plant grows indigenously upon portions of American soil, and that they possess most of that soil. The company have employed Dr. Spencer Bonsall, an man of experience and character, to examine the American tea-plant, and he speaks most confidently and encouragingly as to the success of their undertaking. Dr. Bonsall is a gentleman of good reputation in the scientific world, and for six years he held the responsible position of superintendent and chief manager upon the lands in India of the Assam Tea Company of Calcutta and London. He has reported specifically on the present undertaking. He declares that the tea-plant exists in Pennsylvania and Western Maryland beyond all doubt. "It grows indigenously," he states, "in the greatest luxuriance and abundance, in the places that I have visited, limited, however, to those localities which afford the peculiar soil indispensable to it, as is the case in China, Assam and Japan." The character of the plant differs somewhat from the Chinese variety, but the difference is not greater than might be expected from the difference of climate and soil of the two countries. The leaf—and this is the important point—is almost identical with some of the varieties from which the best tea is made in Assam; and Dr. Bonsall expresses his belief that tea equal to any brought from China to this country could be made from this plant. He thinks that the specimens of both black and green teas that have been prepared from it should satisfy any unprejudiced mind that they will bear favorable comparison with imported teas; and their appearance and quality will improved as the manipulators become more expert, the present process being rude.

## SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

**CAUTION.**—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

**EELS IN CANALS.**—The well-known French author, Edmund About, has proposed that the French Government shall stock all the canals in France with eels, both as a source of revenue to be raised on grants of the right to fish, and of a cheap and wholesome food for the poorer classes of the people.

**SUGAR FROM SNAKES.**—Sugar has been obtained from the skins of snakes by a French chemist, and the process is given in the daily journals of Paris.

A curious observation respecting the rapidity of eagles in their flight, has just been made by a traveler crossing the Grison Alps. An eagle, in flying from one mountain peak to another, at a height of eight or nine thousand feet, performed the distance of five miles in five minutes.

THERE has already been received as computation under the enrollment act 5,500,000, which sum, and all moneys hereafter realized from this source, are to be expended in bounties for enlistments.

## G. E. MOORE,

Assayer and Analytical Chemist,  
No. 612 Sacramento Street,

HAVING ESTABLISHED A CHEMICAL LABORATORY, furnished with every requisite for delicate Analytical work, is prepared to execute the Assay and Analysis of Ores, Mineral Waters, Gunnes, etc., with accuracy and dispatch.

## RIEHN, HEMME & CO., ASSAYERS.

Office, Montgomery street, cor. of California  
OPPOSITE WELLS, FARGO & CO.

Assays Made of ores, Minerals  
and Metals.

### REFERRED WITH PERMISSION TO

Messrs. F. PARROT & CO., Messrs. ALSOP & CO.,  
R. B. SWAIN, Esq., DONOHUE, RALSTON & CO.

CHAS. F. RIEHN, late U. S. Branch Mint, gives Lessons in  
Assaying, also in Mineralogy and Chemistry as far as re-  
quired to become a practical Assayer.

### AGENTS WANTED.

We want a good Agent in every city, town and settle-  
ment, on this Coast. Applicants will send their names  
with reference, when specimen numbers of the **Min-  
ing & Scientific Press** will be forwarded to them,  
and their names added to our published "List of Agents."  
EWER & SMITH.

WM. H. MEAD, THEODORE VAN TASSEL.

## MEAD & VAN TASSEL, HATTERS,

Montgomery st., cor. of Commercial,  
SAN FRANCISCO.

TO OUR FRIENDS AND THE PUBLIC GENERALLY.  
Having Purchased the entire interest of Messrs  
FISHER & CO., in this city, we shall, on the 1st day  
of May assume the management of the

### HAT EMPORIUM,

so long conducted by that firm.

Mr. WILLIAM H. MEAD, for the last seven years Sales-  
man with Messrs Fisher & Co., respectfully solicits a con-  
tinuance of the patronage so long and liberally bestowed  
upon the old House, feeling entire confidence in our ability  
to suit in every particular.

Mr. THEODORE VAN TASSEL, for eight years with  
Messrs Le Gay & Co., would be pleased to see his friends  
at his new place of business.

The long practical experience of Messrs Mead & Van  
Tassel in the Trade justifies them in saying that their  
work cannot be excelled either in finish or durability.  
Having perfected arrangements, we shall be in constant  
receipt, by every steamer of soft goods of the very finest

French and American Manufacture.

Our Stock now on hand is superb.  
Call and examine, and judge of the merits of our claim  
to the title of "LEADERS OF FASHION."  
Respectfully,

MEAD & VAN TASSEL,  
Montgomery street, cor. Commercial,

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of the  
most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

### METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1880, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps,

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—ranging from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,  
San Carlos Mining Co., Owen's River,  
Union Quartz Co., Aurora,  
Triunfo Mining Co., Mexico,  
Napa Quartz Co., Aurora,  
Petaluma Quartz Co., Gold Hill,  
Francis Mellus & Co., Slate Range,  
W. R. Churchill & Co., Mexico,  
Willow Springs Co., Coso,  
Hews, Howe & Co., Rich Gulch Flat,  
F. A. Benjamin & Co., Mexico,  
O. J. Parker & Co., Nicaragua,  
Gibbons & Clayton, Esmeralda,  
Smith & Clouser, S. F. Reduction Works.  
Amagoza Mining Co., San Bernardino,

### MANUFACTURED ONLY BY

GODDARD & CO.,

At the Pacific Iron Works.

SAN FRANCISCO.

Fremont street.

## MINING & SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper  
commenced Sept. 11, 1882. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published

### The Inventor!

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patents  
with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

### The Mining Interest!

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Min-  
ing Stocks, new inventions of Machinery adapted to last  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

### To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of infor-  
mation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

### Terms.

To mail subscribers:—Four Dollars per annum;

### Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Twenty Copies for Twelve Months, \$30.

Names can be sent in at different times and from  
different Post-offices. Specimen copies will be sent  
gratis to any part of the country.

## PEOPLE'S OPPOSITION Steamship Line!

Special Notice.—The  
Line have been withdrawn from the Ni-  
caragua Route until further notice.

### GREAT REDUCTION IN RATES !!

The Fast and Favorite Double Engine Steamship,  
**MOSES TAYLOR,**  
J. H. BLETHEN,.....COMMANDER

Will be dispatched for PANAMA

From Mission street Wharf.

FRIDAY, - - - - - NOVEMBER 13, 1882

Punctually at 9 o'clock, A. M., on

Connecting at Aspinwall, by the Panama Railroad, with  
the Splendid Steamship  
**ILLINOIS** - - - - - 3500 Tons.

The Moses Taylor, since her last trip has undergone  
the most extensive repairs. Her decks have been ex-  
tended forward and aft; cabins enlarged, refitted and  
reupholstered throughout—making her accommodations equal  
to any Steamer on the ocean.

For further information or Passage, apply to  
I. K. ROBERTS, Agent,  
No. 407 Washington Street, San Francisco,  
Opposite the Post Office.

## BOOK KEEPING, Penmanship

AND  
COMMERCIAL CALCULATIONS,  
Taught by J. S. LUTY

PRACTICAL ACCOUNTANT,  
305 Montgomery Street, Corner of Pine.

### TO QUARTZ MINERS.

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving muller, the pulp is drawn through its  
centre and passes under it, between the grinding sur-  
face, to the circumference: from whence it passes again  
over the muller to the centre, through the holes and  
between the grinding surface to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing machines made at the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the parties infringing. My Amalga-  
mators can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.  
sep21 THOMAS VARNEY.

## PATRONIZE HOME MANUFACTURERIES!!!

James Longshore,

Trunk and Valise Manufacturer,  
307 Sansome Street, under Tehama House. Trunks and  
Valises, Wholesale and Retail, Fine Sole Leather Trunks,  
Valises, and a fine assortment of LADIES' TRUNKS con-  
stantly on hand. Trunks covered and repaired.

TAY, BROOKS & BACKUS.

**SONORA AND MONO ROAD.**—The work upon this road, which is alluded to by our Esmeralda Correspondent to-day, has been suspended for the season, but will be resumed at the earliest possible moment. Persons who came over the route within a few weeks past (before the late fall of snow,) inform us that the road was then in fine condition, and only about six or seven inches of snow on the summit. The workmen employed on the Patterson contract had all left the mountains, and Leavitt's and Hot Spring's stations on the other side, were deserted. The new road, so far as it extends, is admirably constructed. The traveler can travel mile after mile on a broad, smooth road, almost as level as a floor. When completed, this will be by far the best mountain highway in California or Nevada. The Commissioners, having finished their labors for the present, made their report last week.

**PROCESSES OF SILVER AND GOLD EXTRACTION (WASTE?)—BY GUIDO KISTEL—SAN FRANCISCO.**

In fulfillment of our promise of the week before last, we present some results obtained in Victoria, Australia. The accounts derived from the *London Mining Journal*, have more than the usual amount of authenticity as they are connected with litigation in one case, and with dividends in the others. Mr. Goulding is the inventor of an amalgamator of the Wheeler Pan class. It is thus described:

"Mr. Goulding's machine does not materially differ from an ordinary arrastra; but being constructed of iron, and in segments, is capable of removal with far greater facility. The great improvement, however, appears to consist in the mode of feeding; by attention to which, Mr. Goulding has succeeded in obtaining very excellent results. The pan is a circular one, with a round bottom; and the drags which are used as a substitute for the ordinary stones are cast to fit. The segments are bolted together, and the joints made tight by india-rubber, or other suitable washers; and the drags being placed in position and attached to the arms, the apparatus is ready for operation. Mr. Goulding thus describes the mode of using the machine:—Put in slowly 5 cwt. of pulverised quartz from the stamps, and add as much water as will reduce it to the consistency of mortar; then pour in 10 lbs. of mercury, and let the machine work for one hour, at ten revolutions per minute; then open the trap-hole in the pan, and let the contents be discharged into a wooden trough, from whence the ore is carried off by a stream of water to a "shaking-table," in which the waste is separated from the quicksilver and amalgam. This operation is opposed to the old method of feeding and discharging continuously, but the results are at least double what may be obtained by any other way of working the same machine. The amalgamators may be worked in tiers, one above another—that is to say, in parts, two machines being worked by the same vertical shaft; and, with proper working, about ten of the pans may be worked by a 20-horse engine. The dry grinding operation should precede the wet amalgamation process. The drags are grooved for amalgamating, and without grooves for the dry grinding. The long mooted question of getting all the gold is, in Mr. Goulding's opinion, solved in this pan, and he claims that each pan can amalgamate 5 tons in 24 hours; and with ten pans, which would give 50 tons a day, or 300 tons a week, the working expenses, including fuel, management, labor, &c., would be less than 2s. per ton. Some of the machines have been in use at Stieglitz for some time, and have given satisfaction."

Mr. Bland the resident director of the Port Phillip Co. reports that—twenty tons of roasted blanket sand which according to an assay previously made, yielded 1 oz 7 dwts and 16 grs. to the ton, [probably 2240 lbs.] yielded in Messrs. Rob-on & Lancashire's arrastra only 15 dwts—20 tons of unburnt blanket sand which according to previous assay yielded 3 oz 6 grs per ton, were reduced with a result of 18 dwts. per ton. Mr Goulding claims that this arrastra is identical with his own.

The Independent Company paid a dividend of 28½. 8s. per share for the month, from 1009 tons of quartz, which yielded only 151 ozs. of gold, or a fraction over 3 dwts. to the ton.

The New Perseverance Company, on the White Horse, paid all working expenses, and placed 160½ to the credit of company, from a month's crushing of 1600 tons of quartz, which gave only 119 ozs. of gold, or about 1½ dwt. to the ton. The quartz was taken from an open cutting about 40 feet deep.

Mr. Fox, President of the Miners Association at Helstone, is our authority for stating that a jiggling machine (of Mr. Hunts) had extracted 12 grs. of gold—the whole quantity the stuff contained—from a ton of sand brought from Van Dieman's Land. Let it be observed that this is little more than 1 part in 100,000. If this be true, jiggling for gold is as good as assaying, in Cornwall, at any rate. If we now turn to the book whose title heads this article—a diligent search will disclose the following matter for comparison.

	Smith's Process common 4-foot Pan.	Wheeler's 4-foot Pan.	Hepburn's 4-foot Pan.
Charge...	50 lbs.—(p. 68). 150 :: (p. 76).	750 lbs.	1000 lbs,
Time....	5 to 6 hours.	3 hours.	4 tons pr 24 hours.
Yield....	50 to 60 per ct. of total silver.	60 to 70 pr ct, p. 69. "At least 10 pr. ct. more than com- mon Pans." p 85.	No estimate
Quicksilver used....	No statement.	50 lbs pr. charge.	No statem't
Loss in Quick- silver....	Unascertained.	Unascertained.	No statem't
Steam for { heating. {	{	{ 1-16 cord of wood } { per 24 hours- }	{
Power requir- ed.....	No statement.	No statement.	2½-horse.
Loss in silver.	40 to 50 pr ct.	30 to 35 pr ct.	No statem't
Samples, Page 85 [1.] Slimes, Pages 85 and 82 [2.] Chemicals Pages 84 and 110 [3.] Adhesion of amalgam, Page 87, [4.]			

1. "The difficulty in stating the loss is chiefly found in the attempt to get a reliable average sample for the assay, especially if wet crushing is going on. The sulphurets and gold are always concentrated in the vats, where the ore falls in from the battery, and every inch in it shows a different amount of silver. The next vat shows the same difference, having, besides, already so much slime that a mixing for the purpose of having the metal equally distributed in the mass, is impossible without drying.

The Calculations on the superiority of Wheeler's pans, at least to the present date, are derived from the comparative yield and the appearance of the tailings, according to which these pans seem to yield at least ten per cent, more than the best common pans.

2. A great difference as to the result will be found in a comparative working of the finest sediment (the slime) which glides between the miller and the common pans almost motionless, as if it were one mass, while in Wheeler's pans the slime is forced under the miller with the same speed as the ore.

3. This is also the reason that it seems as if the quicksilver were protected by the chemicals against being ground to scum, because the black powdered quicksilver is less visible.

Purposely applying a very low temperature, the amalgam, apparently pure, turned black after retorting, and consisted mostly of iron.

4. It occurs often that a great part of the amalgam deposits in the amalgamating pans. At other times, no deposit of amalgam takes place in the pan, or one pan may retain as much as one hundred pounds, when another has none at all. It seems that this appearance depends on a variable electric condition of the iron."

We regret to say that the data on which this is stated as to the effect of electricity, are not given—thus it has little scientific value as it now stands. We, ourselves, however, have observed in a pan in which an electric current has passed through the quicksilver, that the amalgam froze on to the spaces between, and not covered by, the guide blades.

We cannot conclude these comparisons better than by quoting from page 116:

"At Mansfeld, where Ziervogel's method is practiced, in extracting silver from copper matt the loss of silver, according to the recent accounts of Dr. Heinbeck, is 7.06 per cent. in roasting and 1.20 in extracting the silver, making the total loss of 8.25 per cent."

It stands thus, then: California and Nevada Miners! you are wasting from 20 to 40 per cent of your silver over necessary loss, and yet you are told that you will never adopt "precipitation" which saves it.

**STARS.**—The number of variable stars hitherto observed is about eighty, and it is the opinion of some astronomers that every star under the third magnitude is variable. One of these stars a few years ago, apparently disappeared altogether, but about a year ago it re-appeared suddenly, with more effulgence than ever.

**LENGTHENING THE ERIE CANAL LOCKS.**—The *New York Post* says: "The engineers on the Erie Canal are making a survey for the proposed extension of the locks. The surveys and estimates are for locks two hundred and twenty-five feet long between the gates, and wide enough to pass boats twenty-six feet wide—the estimate to be presented to the Legislature on the first day of its next session. It is supposed that locks of these dimensions will enable boats of five hundred tons burden to navigate our canals, and also to pass iron-clad gunboats into the lakes if required. Some idea of the size of these new structures may be obtained when it is remembered that the present locks are only one hundred and ten feet long between the gates, and seventeen feet four inches in the bottom."

**WASHOE GRANITE.**—There is a great deal of this material used in building in Virginia, many of the latest fire-proofs having their window and door sills and cappings, and steps formed of it. It is a very excellent material for building purposes—being light in color, and much softer than the granite in California. It is but little more difficult to cut than ordinary sandstone, but becomes very much harder on exposure. Correctly speaking, it is not a true granite, as it contains no mica—its components being quartz, hornblende and feldspar.

**ALLEGED RICH STRIKE.**—The *Virginia Union* of November 5th, says:

"We were yesterday shown a fine specimen of rock, taken from a ledge just struck upon the Pride of Washoe. It was of a singular character, being composed of iron pyrites and rich sulphurets of silver. The mine is situated in South Spanish ravine, on the northeast side of Mount Davidson. A tunnel has been run into the hill, and at a distance of one hundred and fifty feet from its mouth, a shaft one hundred feet deep sunk. From the bottom of this shaft a drift was run sixteen feet north; then a straight shaft was sunk eighty-five feet, and at that depth this rock was struck. The ledge extends clear across the shaft, which is six feet wide; how much larger it is is not known. This point is about two hundred feet below the surface.

**FINE COPPER ORE.**—The first shipment of ore—10 tons—from the Eureka Consolidated Company, on the Green Ledge, near the Zinc House, Nevada county, arrived in this city on Friday last, and can be seen at the Pacific Warehouse; this is one of the finest lots of sulphurets which we have ever examined. We understand the company has a very heavy vein of this ore, and are just beginning to take it out. They are now raising about five tons per day.

**MEXICAN MINES.**

San Marcial appears to have been drawn from the market, owing to the excellent prospects of the Company. Their mill has been started and works satisfactorily. A large quantity of good ore is stated to be now on the surface.

The Tecoripa Company, it is said, have taken out considerable ore. Their mine is believed to be a promising one, and a mill is to be erected at once.

The Providencia, a portion of the famed Santa Juliana vein, is being reopened and occupied by new owners. The latter mine, tradition says, yielded \$3,000,000 in seven years.

The Cruzecitas Company are at work in the erection of reduction works, etc. The requisite machinery is now at the mine, and the mill will, it is supposed, be in operation within a few months. A large force is employed in enlarging their shaft and in extending drifts.

The Refugio Company is very favorably spoken of. Ample machinery has been sent to the mine. Two veins of gold and silver bearing ore are to be opened immediately.

In the vicinity of these mines and near the old mining town of Jesus Maria, there has been found lately a Quicksilver lead, said to be very valuable. It is represented that at a depth of 18 feet the vein of cinnabar is more than three feet in width, averaging about 25 per cent. The attention of capitalists will doubtless be called to this important discovery so soon as a thorough test of the mine has been made. Meanwhile the work of development is to be vigorously prosecuted.

—Messrs. Coffey & Risdon are constructing a large and substantial brick building, on Market street, for their boiler works.

A GHOST CLUB has been organized in London, having for its object a research into the possibility of "ghosts," or the appearance of the spirit upon earth, after death. That the club is in earnest, may be gathered from the fact that the committee advertise for a "haunted house," one whose reputation is well authenticated. The "Londoners," are looking with much interest for the result of the proposed researches of this association.

**WOODEN VS. IRON SHIPS.**—An ordinary iron ship of 1,000 tons internal measurement will carry a dead weight cargo of 1,500 tons, while a wooden ship of the same internal measurement will carry only 1,463 tons, 27 tons, or two per cent less than the iron ship. The iron ships will weigh 775 tons, while the wooden ship weigh 1,000 tons. The former displaces 2,275 tons of water, while the latter displaces 2,473 tons.

**THE SWIFTEST STEAMBOAT** ever built is said to be the Mary Powell, running between New York and Poughkeepsie. She lately made the run between the two cities at the rate of 25 miles an hour, running time.

**THE POLE** attracts magnets, but our glorious country attracts thousands of Poles.

**TABOR & HILL**, Real Estate Agents and Stock Brokers, place their card in our columns to-day. Messrs T. & H. are members of the S. F. Stock & Exchange Board and San Francisco Board of Brokers. Any business entrusted to their hands will be promptly and faithfully attended to. They may be found at 502 Montgomery street.

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

SAC TADOR.

JOHN HILL.

## Tabor & Hill

**Stock Brokers & Real Estate Agents,**  
502 Montgomery St., cor. Sacramento,

Buy and Sell Mining Stock on Commission. Are members of the San Francisco Stock & Exchange Board, and of the, San Francisco Board of brokers. nov23

### Giffards Injectors,

FOR SUPPLYING OILERS WITH F.E.D WATER without Pumps. No Mill or Mining Company should be without one of these valuable instruments. Send for a Circular.

DAVID STODDART, Agent,

The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventor. EWER & SMITH.

## WHEELER'S Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to flow the triturating loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans have been in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. col6-tf ZENAS WHEELER.

PUMPS!

HARRISON'S

California Lift and Force Pump,

WITHOUT VALVES OR PACKING,  
Suitable for Mines, Fire Engines, Wrecking or Irrigating.  
This is the Cheapest, Lightest and most Durable,  
and least liable to get out of order, of any Pump yet in-  
vented.

ALL SIZES;

Capable of throwing from ONE HUNDRED to FIVE  
THOUSAND Gallons per Minute—For sale by

C. H. HARRISON,

PHOENIX OIL WORKS,

Je 15

50 lbs. MARINE and

Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for Hulls and Decks of Vessels  
from ground Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
or Bottoms of Ships, it is equal to a coat of Stone, and  
quite equal to Copper, no worms will ever effect it, and  
cheaper than any other paint.

DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur,  
three parts Mineral Paint, mix with Coal Tar and apply  
it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes  
of 50 lbs. each, or by the Pacific Metallurgical Works.

25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal  
to covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

DIRECTIONS:

HOUSE:—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil: if a lighter color is  
wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white  
Lead, mix with Linseed oil. Put it thick on a tin Roof  
as one coat when properly applied will last three years.

HEPBURN & PETERSON'S  
AMALGAMATOR.

The subscribers would call the attention of the Min-  
ing Public to their Reducer and Amalgamator, and also  
to their Separator for reducing and separating the mine-  
ral from

GOLD AND SILVER ORES,

manufactured and exhibited at the Vulcan Iron Works,  
Nos 137 and 139 First Street, San Francisco.

These machines secure to the miner a more Expeditions  
and Perfect Reduction and Amalgamation, a less liability  
to accident and delay, and a greater amount of useful  
effect in proportion to the power employed to keep them  
in operation than any other machines now in use for pro-  
ducing similar results. This fact is attested to by their  
general adoption and preference at all the principal  
Reduction Works in Nevada Territory; among which may  
be mentioned the Gould & Curry Mill, the Silver state  
Reduction Works, Yephyr Flat Mill, Pioneer Mill, Eastern  
Slope Mill, Phoenix Mill, etc.

Eye, Ear and Throat.

DR. DE CASTRO,

Oculist and Aurist,

WHO HAS PRACTISED IN NEW  
York and all the principal cities of Europe with  
such unrivalled success, and from each place is in pos-  
session of the most eminent testimonials, may now be con-  
sulted upon diseases of those delicate organs, with a view  
to their permanent cure. Deafness of long standing thor-  
oughly cured. The Doctor employs his (by the Medical  
Society of London approved)

Self-adjusting Artificial Tympanum,

For the relief of deafness, attended by loss or injury of  
the membrana tympani, and for the cure of discharge  
from the ear—the invention of Dr. Castro, M. D., author  
of "Deafness Practically Illustrated as to its Nature and  
Treatment," etc.

The self-adjusting Artificial Tympanum was first intro-  
duced to the notice of the profession at the meeting of the  
Medical Society of London, on the 20th of November,  
1863. An animated discussion ensued on the reading of the  
paper, and several members of the Society bore testi-  
mony to the success of the remedy and the importance of  
the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-  
Adjusting Artificial Tympanum, as he had observed the  
immense benefit a young lady friend of his had received  
from it. She was in fact, quite deaf, and in a most mis-  
erable state—the effect of the tympanum was instantaneous—  
—quite like a miracle. Five more testimonials from  
Members of the Medical College, New York, and the prin-  
cipal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and  
Kearny streets. Entrance on Market street.

Mr. Editor—Having been afflicted  
with deafness for the last two years, originating from a  
severe cold, and for the last month suffering from the  
most excruciating pains in my ear, I was obliged to come  
down to San Francisco to seek relief. After a physician's  
recommendation to wait on Dr. De Castro, on the corner of  
Kearny and Market streets, and underwent one operation,  
and it is with the utmost pleasure I can say my hearing  
was suddenly and without pain entirely restored. I deem  
it my duty to make this known to the public, and to recom-  
mend Dr. De Castro's plan as an aurist.

JOHN REESE, Napa Valley  
James Callaghan, witness.  
San Francisco, July 30th, 1863.

[From the Daily Alta.]

San Francisco, June 30th, 1863

ED'S DAILY ALTA:  
Permit me through your widely circulated journal, to  
say, that my daughter Mary Ellen, has been afflicted with  
deafness since she was thirteen months old, and that she  
has been a member of the Deaf and Dumb Institute since  
it was organized. On taking her to Dr. De Castro, on the  
corner of Kearney and Market Streets, and undergoing on  
der his direction, two operations, she has heard sound  
very distinctly; and is now, I am happy to state, in a  
fair way to get permanent relief. The result, thus far, is sat-  
isfactory; and I deem this notice due to Dr. De Castro for  
his skill; and would recommend all parties similarly af-  
flicted to give him a trial. My daughter has at different  
times been under the care of the most skillful physician,  
not only in California, but up to the period of visitin  
Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT,  
812 Green Street.

## MINING NOTICES.

**Mammoth Consolidated Gold & Silver Mining Co.,** Excelsior District, N. T.—Office 628 Montgomery St., San Francisco, Nov. 18, 1863, Notice is hereby given, that there will be sold at Public Auction, at the office of the Company, in San Francisco, on Saturday January 9th, 1864 at 12 o'clock, M. of that day, to the highest bidder, for cash in U. S. gold coin, so many Shares of the Capital Stock of said Company standing in the names of the following shareholders as will be necessary to pay assessment No. 1, of ten (10) cents per share, due, levied thereon by the Board of Trustees on the 9th of May, 1863; also assessment No. 2, of twenty (20) cents per share, duly levied thereon by the Board of Trustees on the 27th of June, 1863, together with all the expenses of advertising and sale, unless said assessments are previously paid to M. C. W. M. SMITH,  
W. B. EWER,  
A. T. DEWEY.

San Francisco, Dec. 1st., 1863.

#### TERMS OF SUBSCRIPTIONS.

Upon enlarging our sheet, we have determined to adhere steadily to the advance payment for subscriptions, and shall make only a slight advance on old prices. Our rates, hereafter, will be as follows:—For one year, \$5; six months \$3. By city carrier, 50 cents per month.

#### OUR NEW ARRANGEMENTS.

By special notice it will be observed we have associated with us in the publication of the PRESS, Mr. A. T. Dewey, of La Porte, Sierra county, who has been connected with the *Mountain Messenger*, as publisher, for the past five years. We shall now be enabled to carry out our long cherished plan of enlarging the paper, and the friends of mining and mechanical industry may rest assured of soon receiving a journal in every way worthy of their representation and universal support.

#### MINES AT SALT LAKE.

The *Union Vedette*, the "Soldiers paper," published at Camp Drum, Salt Lake, contains the following account of recent mineral discoveries in Utah:—

Evidences of the vast wealth concealed in the mountain ranges of this Territory accumulate daily. In the Wasatch on the east, and in the Oquirrh or West Mountain range, silver, copper and lead have been discovered. In Bingham Cañon, in the latter range, ledges of silver and copper are now being worked, and before Spring, both saints and soldiers will be amazed at the rich developments. On the west, at Deep Creek, at Antelope Springs, at Egan Cañon and Ruby Valley, ledges of silver equal to Reese River and Washoe have been discovered, prospected, and some are being worked. On the north, at Butte Creek, placer gold mines are paying the Morrisites richly, and at Hickman's Butte a whole mountain of cinnabar has been discovered and will be worked in the Spring. Still further north, on the Snake River and the Blackfoot, gold diggings equal to the Boise and Bannock have been worked all Summer. In fact the whole Territory is one vast deposit of rich minerals, only awaiting industry and intelligence to develop it.

**TAXING THE MINES.**—C. L. Strong, Esq., Superintendent of the Gould & Curry claim, was before the County Board of Equalization to-day for the purpose of having the taxes of that claim equalized. The Board had assessed the improvements on the claim at eight hundred thousand dollars, but Mr. Strong informed them that they might tax it three hundred thousand more, and the company would be satisfied, which they did—so this one claim is assessed at upward of a million of dollars; and yet there are men in this Territory who insist that the mines do not bear any portion of the burdens of taxation. One such fact is worth a million of shallow, sophistical arguments, whether they emanate from judge, lawyer or loafer.—*Virginia City Bulletin*, Nov. 30.

The ship *Lizzie Moses*, for New York, takes 200 tons of Napoleon Copper ore.

**SAN FRANCISCO TWENTY-ONE YEARS AGO.**—A. G. Toomes, of Elder Creek, says the *Cull*, who lived in this city during most of the Summer of 1842, furnishes the *Red Bluff Beacon* with the names of the population of Yerba Buena (now San Francisco) at the time. They are:

William Ray and wife, of the Hudson Bay Co., and three employees; N. Spear and wife; Captain Hickley; Mr. Davis, a blacksmith; Robert Davis; Daniel Still; Mr. Viogel; Peter Suerreback; J. Fuller, wife and three children; Messrs. Teal & Titcomb; Mr. Limantour; Mrs. Inna Briones and daughter; Mr. Rock; Juan Padillo; R. H. Thomas, and A. G. Toomes. The number of buildings was thirteen.

What a change! In twenty-one years the little hamlet of twenty-seven souls and thirteen buildings, has grown to a city of one hundred thousand people and thirteen thousand buildings. Of the inhabitants that were here in 1842, we only know of six now in existence, viz: Robert Davis, at Honolulu; Limantour, in Mexico; Mrs. Fuller and two of her children, in this city, and Mr. Toomes, of Elder Creek.

**WHO ARE THE HAPPY?**—Lord Byron said: "The mechanic and working men who can maintain their families, are, in my opinion, the happiest body of men. Poverty is wretchedness, but even poverty is, perhaps, to be preferred to the heartless, unmeaning dissipation of the higher orders." Another authority says: "I have no propensity to envy any, and, least of all the rich and great; but if I were disposed to this weakness, the subject of my envy would be a healthy young man, in full possession of his strength and faculties, going forth in a morning to work for his wife and children or bringing them home his wages at night."

**CALIFORNIA ROZEN FOR THE EAST.**—This new article of California export, says the *Evening Journal*, appears to be assuming quite a prominent stand among the products of the State. The hundred barrels for New York by the William Cummings is the second shipment, and the difference between the cost here and the price in the East promise the shippers a handsome profit. California rosin costs at home \$15 per barrel; the price it brings in New York is \$45 per barrel. The resources of this State for naval stores add an additional importance to her relationship with the Government during the existence of the war.

**AN INCIDENTAL GOOD.**—A Boston paper says that if Exchange will only hold good at the present high figures for a few months, we shall manufacture many articles which we now import. A gentleman in New York has recently imported twelve French families from Lyons, who are killed in the manufacture of velvets, with the intention of starting a manufactory of first-class velvet in this country. The Waltham Watch Manufactory has made us independent of Geneva and the Portsmouth Mills will soon enable us to do without Coates & Taylor.

**IRISH MOSS** has been found growing abundantly on the rocks along the beach in Scituate, Mass., and about three thousand barrels are gathered annually. It is worth at first hands from five to six dollars per barrel.

**BELOW THE ATLANTIC.**—Soundings in the Atlantic have been particularly pushed forward, and have excited, on account of the telegraph cable, more general interest than any other yet taken. They have revealed the fact that two hundred and thirty miles from the coast of Ireland the water is still shallow; or in other words, that there is another Ireland only waiting to be raised—thus reversing the famous panacea for keeping the country quiet. It is just beyond this that the true Atlantic begins; the gulf suddenly sinks to nine thousand feet. Thus Ireland may one day have a coast line as high as the Alps. The whole floor of the Atlantic is paved with a soft, sticky substance, called ooze, nine-tenths consisting of very minute animals, many of them mere lumps of jelly, and thousands of which could float with ease in a drop of water; some resembling toothed wheels; others, bundles of spines or threads shooting from a little globule. Some, however, are endowed with property of separating flint from the sea water—which is more than every chemist could do; and there are hundreds of square miles covered with the skeletons of these little creatures. Part of the ooze is doubtless from the clouds of rain-dust which rise from the vast steppes of South America in such masses as to darken the sun, and make the animals fly to shelter, and which, after sweeping like a simoon over the country, lose themselves in the 'steep Atlantic.' No bone have been found of the large animals, so that the kraken and sea serpent might sleep their last sleep, and leave not a bone or a vertebra to tell the tale. Not a mast or anchor, not a block or stran, not a coin or a keepsake, has been found to testify of the countless gallant men, who have gone down amid the pitiless waves.—*All the Year Round*.

**THE FIRST SAWMILL.**—The old practice of making boards was to split up the logs with wedges; and, inconvenient as the practice was, it was no easy matter to persuade the world that the thing could be done in a better way. Sawmills were used in Europe in the fifteenth century; but as lately as 1855 an English ambassador, having seen a sawmill in France, thought it a novelty which deserved a particular description. It is amusing to see how the aversion to labor saving machinery has always agitated England. The first sawmill was established by a Dutchman, in the year 1663, but the public outcry against the newfangled machine was so violent that the proprietor was forced to decamp with more expedition than ever did Dutchman before. The evil was thus kept out of England for several years, or rather generations; but in 1693 an unlucky timber merchant hoping that after so long a time the public would be less watchful of its interests, made a rash attempt to construct another mill. The guardians of the public welfare, however, were on the alert and pulled the mill to pieces.

The effects of narcotic poisons seems to be destroyed by pouring cold water on the face and head. A girl, accidentally poisoned in England with laudanum, had had all the usual remedies administered without effect; when cold water was applied, however, she breathed more easily and bled from the nose. The treatment with water being suspended, she relapsed into coma; being resumed she again rallied and in 60 hours was completely recovered.

[From our Traveling Correspondent.]  
COPPEROPOLIS.

MR. EDITOR:—I am happy to state that our exertions to bring this rich country into proper notice, and raise it to its legitimate rank, are meeting with success, as well as giving satisfaction. I am daily in receipt of letters from the Bay and country congratulating me upon the manner in which I have carried out your instructions. While this is the case, I shall be content to fulfil my mission to the end, though involving considerable labor, expenses, and inconvenience. I am also happy to state that Mr. Handy of San Francisco is now following me, taking a survey of the mines, with a view to publish a map of the copper district, which will be of immense value to the public. Mr. H. is the surveyor of the Stockton Railroad to Copperopolis via Knight's ferry, the importance and necessity of which I shall have to speak more fully hereafter. He has politely requested to make use of my letters, which I readily granted, feeling assured of your compliance.

In my last letter I stated the mines north of Copperopolis were so numerous and far apart that I was obliged, at that time, to confine myself to those around Campo Seco. We must start once more, therefore, from Copperopolis, north of Salt Spring Valley, commencing with the

#### KEYSTONE.

Whether this name was given to the mine by accident or design I cannot tell. It is, nevertheless, peculiarly appropriate, for without doubt, it is the keystone of the most magnificent and incomparable copper discovery in the world, fabulous alike in richness, extent, and permanency. When, in Cornwall, the Stephenson Consolidated lode stood developed for seven miles. It ranked for years the copper wonder of the world, pining its grandeur only to the dawning genius of Australia with her Burra Burra and Capunda, and now how absolutely insignificant are both of these systems? Here today, in a country unequalled for climate, scenery, facility of transit, and every other attribute of human happiness and success, stands the old Keystone, the centre of a copper system, reliably developed north and south from Mariposa to Nevada, one hundred and ninety-five miles, and embracing its parallels for twenty-five miles wide. One hundred years hence, and what mind can foreshadow its effects upon the elevation of the State and nation? And when this glorious valley, with its grand, broad, level sweep, from the Stanislaus to the Mokelumne, thence to Ione and the Cosumnes, is a mighty net-work of great cities, and private villas, what a histrionic spot the Keystone will be! May we not suppose that the people of that day will trace upon some old bronze monument, made from its own ore, which will no doubt then raise its head to heaven, the names of Read, McCarthy, Ryan, Mendeville, Aitkin, Powning, and in memory of the original discoverers of this, even now famous lead?

Some may think, perhaps, this is an exaggerated introduction. Before I get through I shall show it is not. I am a great believer in copper, and I am still a greater believer in this particular system. Let us see if I am right, and the Keystone worthy the reputation I have given it. The claim contains 3,300 feet, divided into 3,300 shares. There are three shafts respectively 320, 50 and 150 feet deep. Through the mysteries of these I was politely piloted by Mr. Richard Powning, or Capt. Dick, as he is familiarly called. I shall begin with the upper or north shaft, 320 feet. In this there are seven drifts running in opposite lines, with every other requisite for convenience and expedition in work. The lead in the bottom drifts, running in 40 feet, is nine feet wide; containing three feet No. 1 ore, six feet No. 2; the latter averaging over 12 per cent. The next level above, at the depth of 200 feet, drifts and ores about the same. The next level, with longer drifts, shows the vein ten feet wide; six inches No. 1, the balance, No. 2 ore, having already been taken out. In these upper levels there are thousands of tons of No. 2 ore, hitherto neglected, but which being concentrated, in the new works now on the eve of completion, will alone be a fortune to the company. This shaft is 500 feet below the northern line, where it joins the Consolidated. Some 2,000 feet down towards town stands the old discovery shaft, 50 feet deep, with a drift 40 feet long. Here the vein is nine feet wide, 2 feet of No. 1, and 7 ft. of No. 2 ore. Then 500 feet lower down again, 17 feet off the Union line, is the third main shaft, 160 feet deep, with two drifts, eleven feet each. Here the vein, at the bottom, is 12 feet wide;

four feet No. 1, eight feet No. 2 ore. On the next level, 50 feet above, the side drift 150 feet long shows the vein two feet wide, equally divided into No. 1 and No. 2 ores. The opposite drift runs into the side claim east, called the Inimitable, leaving an 18 feet horse between the two leads, and shows that vein 13 feet wide all No. 2 ore, but averaging 15 per cent. This runs 20 feet on the vein. On the next level, 50 feet higher, a drift runs 15 feet on the vein, showing pretty much the same results. In this shaft there are also thousands of tons of No. 2 ore ready for stopeing the moment the concentration works get under weigh. There are also some other "prospecting shafts" down in different parts of the claim, disclosing equally favorable results, but which would be tedious and unnecessary to particularize.

The concentration works, on the eve of completion, (being expected to start next Saturday) form a very distinguishing feature of the Keystone. They are, I believe, the first of the kind in America, certainly in California, and throughout are of the most substantial and first-class character, reflecting the highest credit on all concerned. They stand about 1,800 feet from the uppermost or northern shaft, from which a rail is laid to bring the ore down to them. In machinery they embrace every modern compliance and improvement. The entire building is 200 feet long, 30 feet wide, and gives an immense business appearance to the town. The engine is 40-horse power, of Donahue & Co's best style. Of its effectiveness you may judge, when it is intended to pump from two shafts, hoist from another, run five jiggers, and all the various machinery connected with the entire works. It is true these works involve a large expense; but then, we must remember, besides the immense outside time and labor they will save the company, by reducing all the No. 2 ore, and freeing it from every particle of refuse rock, they raise the value of every ton of that ore from 12 to 18 or 20 per cent. After a careful examination, I rate the capacity of the Keystone at 550 tons per month.

I cannot close this account without paying Capt. Dick a tribute of praise he deserves for putting the mine in its present auspicious condition. He has unquestionably a thorough knowledge of copper mining in all its branches. If the company will only be patient, leave him alone, and let him stope up his ground clean as he goes, they will not regret it, when the ensuing year closes upon them. It is only just to say that Capt. Dick has lately also done equally good work on the Caleveras claim. Next in succession, proceeding up the valley, comes the

#### CONSOLIDATED.

This claim contains 1,800 feet divided into 1,800 shares. It adjoins the Keystone, being located at the same time, and is an extension of it. It contains three shafts, respectively of 18, 70 and 40 feet. It is, however, by no means developed, though presenting many favorable indications. In the 70 feet shaft, there is the strongest body of mundic I have yet seen. I confess my partiality to mundic, and think that copper will be struck sooner in this shaft, than in the one of 40 feet, where the blue slate is strangely impregnated with yellow sulphurets. Work is suspended until next Spring, when machinery will be put up. Next comes the

#### GREAT WESTERN.

This is also an original location, containing somewhere about 1,800 feet, divided into 13 shares. This claim lies idle, I understand, from want of capital, no other work being done than what is necessary to represent it. Following this claim are several others, which, as they are simply locations, and in the same condition, it will only be necessary to mention. They are the Salt Spring Valley, the Masonic, and the Jefferson. From here, some distance up the valley, it will be very difficult to locate the lead. The best advice I have heard given, is that of the Cornishman, who suggested the propriety of sinking 500 feet, and then drift north, south, east and west. I think it likely the lead might be struck under those circumstances.

We are now supposed to be some three miles from the Keystone, when we leave the valley to the left, and going up the Bear Mountain range some half mile, or more, reach the

#### CROCKETT.

This is quite a celebrated claim, opening beautifully, with an established vein of splendid ore. It is a distinct vein going to the east side of Bear Mountain from Copperopolis town. It contains 3,150 feet, and is incorporated. The mine is now fixed up for permanent work, and will develop

itself rapidly. A short distance from the Crockett, bearing east of south, is the

#### BEAR MOUNTAIN.

This claim is still undeveloped, and suspended for a time. It is on the same lead as the Crockett. It contains 3,000 feet, divided into 20 shares. Work to be recommenced in the Spring. Passing on in an almost easterly course over the hills we come to the

#### ANTELOPE.

This is also a celebrated mine, but has fluctuated up and down more, perhaps, than any other in the district. It is not on the Crockett, but runs east of it. Occasionally excellent ore was taken out, but nothing permanent. It was originally called Beauregard; the two are now consolidated. The claim contains 3,250 feet, divided into 200 shares. It unquestionably opens in beautiful style, carrying carbonates and oxides from the top, with well developed walls, at one time 20 feet apart, but now compressed to 9 feet. There is considerable gossan on the surface, quite auriferous. The rock, however, is still heavy, and corrupt, carrying copper and sulphates of zinc certainly; some say silver; of the latter I am no judge. At the request of Mr. Garrard, the Supt., I spent half a day with him here and at last found a vein of better ore than they have ever had, about a foot thick. This was in the side drift. Twenty-five feet more put on the shaft, I feel certain, will open a three feet vein. I beg to acknowledge the polite attentions of Mr. Garrard's family, and hope for their sake the Antelope will come out right. I think there is no fear of its not doing so in the end.

I must now take you, at least six or seven miles along the Angel's Camp round, to within sight of Altaville, to claims I visited on my arrival here, but which I could not notice before without confusion. I hope the Colnor boys will accept this apology for it as the fact. Turning into the woods some distance beyond Hinckle's ranch, are three claims, though I cannot pretend to locate the system they are on. The first is the

#### EMMETT.

This claim contains 2,200 feet, divided into 11 shares. The main shaft was down 50 feet then, now I suppose considerably more. The rock carried iron largely, but sufficient copper to make it good ultimately. Our lucky friend Elmore is concerned in this claim, so it is sure to turn out well. I hope so. Adjoining the Emmett is the extension

#### RIISING STAR.

This claim contains 3,200 feet, divided into 16 shares. They are not doing much until the Emmett gets down. This claim, however, lying as it does between the Emmett and Colnor, I think it must be a safe thing. Next and last in this direction is the

#### COLNOR.

I find my notes have become somewhat obscure, but I think the claim contains 3,200 feet divided into 16 shares. The old shaft had to be abandoned as it dipped to much in the hill to be workable. The new shaft, very well put down, through immensely hard rock, must now be down about 100 feet. This is the claim I mentioned in my first letter of the Stockton Fair, as having such splendid specimens there. The rock in its formation is very pure. I should like to see this mine again if possible, and as I go to Angels to see about your own claim there, I shall endeavor to give the boys a call. I have great faith in the Colnor. L. H.

A LONDON professor lectured recently on adulterations of food. He handed around coffee, which was pronounced excellent, then told the audience that they had been regaled with a mixture of bullock's blood and, chicory, sheep's liver, dried and old coffee grounds. He gave them capital porter too, made of spirits of wine, gum arabic and burnt sugar.

DRIED UP.—The Rocky Mountain News says: The Platte is not the only stream that has entirely failed this season. The Arkansas is entirely dry for two or three hundred miles. The Huerfano, and other large tributaries coming into the Arkansas from the South, are also dry. We presume that Red River, and other streams of the South, are in the same condition. In Utah, and further North, water has never before been so scarce since the country was known.

Some idea may be formed of the tremendous effects of the powder magazine explosion at the foot of Seventy-ninth street, N. Y., from the fact that a steamboat traveled all the way to New Haven on the Sound

**MACHINERY FOR OWEN'S RIVER.**—Four or five teams, heavily loaded with quartz mill machinery, (says the Esmeralda Times, of November 25th.) destined for Owen's River country, passed, through town this morning. Public attention is rapidly turning to the above section, and a big rush will be made there in the spring. Parties are going from here nearly every day. The confidence shown in those sending down machinery for mills is not without cause. That section is undoubtedly rich in both mineral and agricultural wealth.

—It is found by investigation that the number of men who have been actually killed in this war does not fall short of half a million.

**G. E. MOORE,**  
Assayer and Analytical Chemist,  
No. 612 Sacramento Street,  
HAVING ESTABLISHED A CHEMICAL LABORATORY,  
furnished with every requisite for delicate Analytical work, is prepared to execute the Assay and Analysis of Ores, Mineral Waters, Guanos, etc., with accuracy and dispatch.

We want a good Agent in every city, town and settle-  
ment, on this Coast. Applicants will send their names  
with reference, when specimen numbers of the **Min-  
ing & Scientific Press** will be forwarded to them,  
and their names added to our published "List of Agents."  
EWER & SMITH.

WM. H. MEAD, THEODORE VAN TASSEL.  
**MEAD & VAN TASSEL,**  
**HATTERS,**  
Montgomery st., cor. of Commercial,  
SAN FRANCISCO.

TO OUR FRIENDS AND THE PUBLIC GENERALLY.  
Having Purchased the entire interest of Messrs  
FISHER & Co. in this city, we shall, on the 1st day of  
May assume the management of the  
**HAT EMPORIUM,**  
so long conducted by that firm.

Mr. WILLIAM H. MEAD, for the last seven years Sales-  
man with Messrs Fisher & Co., respectfully solicits a con-  
tinuance of the patronage so long and liberally bestowed  
upon the old House, feeling entire confidence in our ability  
to suit in every particular.

Mr. THEODORE VAN TASSEL, for eight years with  
Messrs Le Gay & Co., would be pleased to see his friends  
at his new place of business.

The long practical experience of Messrs Mead & Van  
Tassel in the Trade justifies them in saying that their  
work cannot be excelled either in finish or durability.  
Having perfected arrangements, we shall be in constant  
receipt, by every steamer of soft goods of the very finest

**French and American Manufacture.**  
Our Stock now on hand is superb.  
Call and examine, and judge of the merits of our claim  
to the title of "LEADERS OF FASHION."  
Respectfully,

**MEAD & VAN TASSEL.**  
Montgomery street, cor. Commercial.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on  
this coast, renders it of the highest importance that the  
Machinery employed for this purpose should be of  
the most Effective, Economical and Durable Character.  
It may be safely said that Millions of Dollars have al-  
ready been expended upon the various experiments in this  
class of Machinery, and it is a fact well known to all  
who have had any practical experience in the matter,  
that every new process developed during the past twelve  
years, has been set down as a failure. The Ordinary  
Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has  
suggested, is now regarded, by common consent, as the  
only reliable

### METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed  
to combine all the improvements which the experience  
of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the  
country, and have been, for the three past years, sub-  
jected to the most severe of all tests—that of constant  
use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the  
mineral regions of California, Nevada and Mexico, and  
have established a claim to public confidence, never yet  
equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron,  
and, consequently, are not affected by the intense heat  
and dryness of atmosphere, common to all mining local-  
ities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of  
Stamps, 25 per cent, more rock than any other mill in  
use. Each Battery is complete in itself, and forms a  
perfect mill—while any number of them can be added  
at a subsequent time—thus preserving the symmetry and  
uniformity of the Mill

As an evidence of the increasing favor with which  
these mills are regarded, we would mention that the  
Celebrated Ophir Company first introduced them into  
their works in 1880, and have been adding a number of  
Batteries, each subsequent year, until they now have  
Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, be-  
fore shipping, each piece being marked and numbered,  
so that they can be put up and set at work in ten hours  
after arriving on the ground. They are made of two sizes,  
four and five Stamps each. The Four Stamp  
Battery weighing complete about 6,000 pounds,  
and the Five Stamp about 7,000. The Mortar Bed being  
cast in sections, when desired, so that the mills can be  
packed over any mountain road.

We annex the names of a few well known Companies  
who have adopted them—running from four to seventy-  
five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcel Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,  
San Carlos Mining Co., Owen's River,  
Union Quartz Co., Aurora,  
Triunfo Mining Co., Mexico,  
Napa Quartz Co., Aurora,  
Petaluma Quartz Co., Gold Hill,  
Francis Mollus & Co., Slate Range,  
W. R. Churchill & Co., Mexico,  
Willow Springs Co., Coso,  
Hews, Howe & Co., Rich Gulch Flat,  
F. A. Benjamin & Co., Mexico.  
O. J. Parker & Co., Nicaragua,  
Gibbons & Clayton, Esmeralda,  
Smith & Clouser, S. F. Reduction Works.  
Amagoza Mining Co., San Bernardino.

MANUFACTURED ONLY BY  
**GODDARD & CO.,**

At the Pacific Iron Works,

SAN FRANCISCO.

on 125 to 126 First street, and 126 to 144

Fremont street.

## MINING & SCIENTIFIC PRESS. THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR: VOLUME VI.—NEW SERIES.

A new volume of this extensively circulated paper  
commenced Sept. 11, 1882. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Art, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader: and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

### The Inventor!

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patents  
with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

### The Mining Interest!

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Mi-  
ning Stocks, new inventions of Machinery adapted to that  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

### To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of infor-  
mation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

### Terms.

To mail subscribers:—Four Dollars per annum;  
**Club Rates.**  
Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Names can be sent in at different times and from  
different Post-offices. Specimen copies will be sent  
gratis to any part of the country.

**EWER & SMITH, Publishers,**  
Room 57, Government House, Corner of Washington  
and Sansome streets, San Francisco.

**I. C. E. KLEPZIG & CO.,**  
**GUN MAKERS,**

DEALERS IN GUN MATERIALS,  
733 Washington street, San Francisco,  
[One Door above Kearney street.]

Repairing done in a workmanlike manner at the short-  
est notice.  
Gilding, and also Silver Plating, by E. Ekland. je21

**LEANDER RANSOM,**  
**Civil Engineer**

AND  
**SURVEYOR,**

Having been connected with the public works  
of the State of Ohio for 20 years, and the public  
surveys of the State of California for 7 years.

ALSO  
**STATE LOCATING AGENT.**

And as such having the sale of  
**600,000 ACRES OF STATE SCHOOL  
LANDS,**

At the low price of \$1.25 per Acre.  
Terms—Twenty per cent in cash and the balance  
on a credit of several years.  
OFFICE, 323 Montgomery streets. oct-3

**D. NORCROSS,**  
Masonic Temple, No. 6, Post Street.

**Military Goods of all Descriptions.**  
Navy Trimmings and Embroideries.

REGALIA FOR ALL ORDERS.  
aug 17

## PEOPLE'S OPPOSITION Steamship Line!

Special Notice.—The line has  
been withdrawn from the Ni-  
caragua Route until further notice.

### GREAT REDUCTION IN RATES!!

The Fast and Favorite Double Engine Steamship,  
**MOSES TAYLOR,**  
J. H. BLETHEN..... COMMANDER  
Will be dispatch for PANAMA  
From Mission street Wharf,  
**WEDNESDAY, - DECEMBER 23, 1883.**  
Punctually at 9 o'clock, A. M., on  
Connecting at A-shipwall, by the Panama Railroad, with  
the Splendid Steamship  
**ILLINOIS - - - - - 2500 Tons.**

The Moses Taylor, since her last trip has undergone  
the most extensive repairs. Her decks have been ex-  
tended forward and aft; cabins colored, refitted and  
repainted throughout—making her accommodations equal  
to any Steamer on the ocean.

For further information or Passage, apply to  
K. K. ROBERTS, Agent,  
No. 407 Washington Street, San Francisco,  
Opposite the Post Office.

## BOOK KEEPING, AND COMMERCIAL CALCULATIONS,

Taught by J. S. LUTY  
**PRACTICAL ACCOUNTANT,**  
305 Montgomery Street, Corner of Pine.

### TO QUARTZ MINERS.

All persons interested in Mining Ma-  
chinery are invited to call at Donahue's Foundry and  
examine my improved Amalgamator. It is unquestion-  
ably superior to anything now known for amalgamating  
Silver and Gold. It works 1000 pounds at a time, and  
will amalgamate over three tons a day. By the motion  
of the revolving miller, the pulp is drawn through its  
centre and passes under it, between the grinding sur-  
face, to the circumference; from whence it passes again  
over the miller to the centre, through the holes and be-  
tween the grinding surface to the circumference as be-  
fore. Thus a constant circulation of the pulp is kept up,  
bringing the particles of ore again and again under the  
muller, and reducing the whole mass to an impalpable  
powder.

No quicksilver lies between the surfaces to be ground,  
but at the circumference and centre of the pan where the  
metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in De-  
cember last, and all persons are again warned against  
purchasing or making use of the Miners' Foundry called  
"Wheeler's Amalgamator," as they are an infringement  
on my patent, and a suit is now pending in the U. S. Cir-  
cuit Court against the parties infringing. My Amalga-  
mators can be seen running at Donahue's Foundry, where  
all can judge of their operation and the very superior  
style in which they are being manufactured.  
sep21 THOMAS VARNY.

## PATRONIZE HOME MANUFACTURES!!!

**James Longshore,**  
Trunk and Valise Manufacturer,  
307 Sansome Street, under Tehama House. Trunks and  
Valises, Wholesale and Retail, Fine Sole Leather Trunks,  
Valises, and a fine assortment of LADIES' TRUNKS con-  
stantly on hand. Trunks covered and repaired.  
aug 3

**APARTMENTS.**  
FURNISHED APARTMENTS, WITH OR WITHOUT  
Board, at 1018 Powell Street, between Clay and  
Washington Street. Persons desirous of a respectable  
home will do well to apply. jyl

## FOR SALE.

**PATENT PRESSED RUSSIA IRON MINING PANS.**  
Russia Iron Quartz Screens for Mills;  
Portable Forges; Cauldron Kettles;  
Pumps, both Frame and Lift;  
Lead Pipe; Rubber Hose;  
Wrought Iron Pipe;  
Blow Cocks; Couplings; Play Pipe  
Cooking Stoves and Heating Stoves  
Tin Plate; Sheet Iron; Sheet Copper;  
Fruit Cans of Various Kinds;  
Lard and Butter Cans of all Sizes;  
Iron Wire; Brass Wire; Copper Wire;  
Copper Rivets and Burrs; Iron Rivets; Etc.

We are also manufacturers of the  
**UNEQUALLED  
MONITOR COOKING STOVE  
Or RAN E,  
FOR HOMES.**

To which we call particular attention.  
je-29 TAY, BROOKS & BACKUS.

## THE DEBT AND RESOURCES OF THE UNITED STATES.

The *Banker's Magazine* for October last, contains a carefully written article upon "The Debt and Resources of the United States," and introducing therein a comparative statement of the credit of Great Britain and the Federal Government, in their respective times of trial. We condense as follows:

The normal prices of the British 3 per cents being 93, and standing always above 89 from 1730 to 1745, they fell during the Scotch rebellion of 1745, to 76; at the close of the American war (1781) to 54; in 1797 to 47½, and in 1854 (Crimean war) to 85½.

The United States 6 per cent. 20 year coupon bonds were at 89 to 92 in September, 1861; in April, 1862, rose to 98; in June to 107½; fluctuated between July and December, from par to 104; and from January, 1863, to April, varied from 90 to 106½.

The price of gold in the respective markets presents the following relative ranges:

In the English market gold was above 25 per cent. premium for three years from 1811; for two of those years above 30 per cent; one year and a quarter above 36, and at 41½, from November, 1812, to March, 1863.

At New York, five months after the suspension of specie payments, gold was at 4 per cent. premium; during three and a half months, from 3d July to 20th October, 1862, it was under 30; for two months after, above 33; from 1st of January, 1863, to 3d of March, fluctuating from 33½ to 72½; after which it went down to 46 on the 1st of June.

This history, considered with reference to the respective conditions of the two nations, is all in favor of the Federal Government. A comparison of our present credit with that of our own Government in former exigencies, is even more surprising. The loans of 1799 and 1800 were sold at a discount of 17.20 per cent; those of 1813 at 12 and 11.75; those of March, 1814, at 18.86; and the total of the discounted loans 1799 to 4th March, 1861, at an average discount of 12.55 per cent; while the total of the present Secretary's loans sold under par, calculated upon the par of 6 per cents., fall to 5.9 per cent. average discount. On a full review of all the facts, are we not safe in saying that in the very midst of this hurricane of civil war, our Treasury is in smooth water?

## UNITED STATES CURRENCY.

As in case our National Debt, we are best able to grasp and understand the question of our currency, by comparing its present condition with that of the corresponding periods of English history—a history that worked itself into issues so well understood that we may readily see the facts of our own case, and forecast the results by the light thus afforded to us.

The figures that did the service of reducing John Bull to despair in 1815, stood thus, according to Mr. Lloyd, who is received as the best authority in this branch of statistics:

Bank of England notes and local bank circulation of the three Kingdoms: \$504,000,000; Exchequer Bills, \$202,000,000; Postal Circulation, \$706,000,000.

This amount, at the time the population of Great Britain, gave an average of \$37.16 per capita.

When the wealth of England was but \$10,400,000,000, the circulation was four times greater than in 1844—'51, when the wealth was more than double that of 1815, or in relative amount, full eight times greater. Here was abundant opportunity, and no slight apparent warrant, for an outcry. England's gold was drained to exhaustion by her war expenses and subsidies paid abroad. Bonaparte held the opinion that she must succumb when reduced to an utterly redemptionless note currency. The opponents of the government, the bullion-heads, and the whole body of alarmists and despondents held the same doctrine.

The famous Bullion of the House of Commons sustained it; arguing as ably as the best of our Democrats, for a cash, and against a credit, circulation; and recommending an instant return to cash payments, without regard to consequences, or any respect to impossibilities.

Now, let us see how our greenbacks and other currency compare—not with the assignats, nor even with the "Continental money," of our Revolution, but with "the depreciated and depreciating" Bank of England notes, every dollar of which was at their par of gold, three years after they were at their worst.

## THE BANK NOTE CIRCULATION OF THE UNITED STATES.

The bank note circulation of the United States, from 1852 to 1859, eight years, averaged 146,000,000, making \$9.06 per capita. On the 1st of May, 1863, the bank circulation of the loyal States (assumed to be the same as in December last) was \$168,400,000; the United States notes and fractional currency \$394,920,956. To these add one year of indebtedness, which may be taken to correspond, in the way of circulation, to the Exchequer bills of England, which amount to \$142,750,000—a grand total of \$706,070,956.

Thus it appears that our total circulation, in 1853, is exactly equal to that of England in 1815—our wealth three-tenths greater, and our per capita circulation more than one-fifth less. Moreover, their circulation quadrupled their own average of a much later date; ours slightly more than trebles our average of a period of three years gone.

Our inflated currency, so far as the banks are concerned, does not exceed our average in specie-paying times more than twenty-two millions, or fifteen per cent. As to the greenbacks, the history of the twenty-five loan, in the month of May, shows that the Secretary can find any surplus of them in circulation, at the rate of two millions a day; or, if he were in a hurry, by calling for bids he could do it, at twenty days' notice, at once, which brings us to the conclusion that the day on which the war closes, will be just the day before the resumption of specie payments, to all intents and purposes. The suspension of specie payments lasted twenty years in England. Her Bullionists bravely, for all those twenty years, in the very teeth of the facts, declared that a purely credit circulation could not be maintained, and under favor of war prices and speculation in gold, kept up the cry of "depreciation" to the bitter end.

Taking it for certain that this piece of history must get a rehearsal among us, we content ourselves with furnishing the material for better opinions, to better men, and precedents and forms of despair to those who must needs see things the way they don't like them, and don't like to see things just the way they are.

WICKS FOR KEROSENE OIL LAMPS.—One of the most frequent causes of the bad burning of mineral-oil lamps, says the American Gas Light Journal, arises from the employment of damp wicks. Cotton, like most other vegetable fabrics, readily absorbs from one-fifth to one-sixth its weight of moisture from the atmosphere; this prevents the free ascent of the oil, and leads to charring of the wick, and the production of an imperfect flame—hence, it is exceedingly important that a new wick should be thoroughly dried before it is placed in a lamp. When it has been once saturated with oil, the further absorption of moisture is prevented. The trouble of holding a wick before the fire till it ceases to give out any vapor is so trifling as not to be taken in consideration, and the improvement in the flame and regularity of burning is considerable.

THE PACIFIC MONTHLY has again changed Editors, and is now under the management of LISLE LESTER, a lady who has recently arrived among us from Wisconsin. The new editor is not without experience in her profession, having long been favorably known as a writer of decided ability. She has at different times edited several monthly and other periodical publications, in which positions, as well as in miscellaneous newspaper correspondence, she has displayed marked talent. The magazine before us, though but partially prepared under her charge, exhibits a taste and genius which is eminently promising of future success. We extend to her a cordial greeting, and our best wishes in her new field of labor.

THE GOLDEN AGE, Reese River, is now down about sixty feet, with a four foot vein. One hundred shares have changed hands during the week—principally at private sale; prices varying from \$30 to \$65. We notice quotations of the Stock Board at \$30. These shares are principally sought after by Reese River mill men and speculators from that region. A very fine specimen of chloride of silver ore, from this vein, has been left at this office, and having been subjected to the heat of a furnace, is completely covered upon one of its sides with globules of silver. The stockholders know, beyond a doubt, that this vein is rich, and hence the reluctance on their part to dispose of the shares.

THE most remarkable blast in the history of iron mining took place at the Lake Superior mine a short time since. In ordinary ones but one and one-half inch hole in diameter is drilled, but in this case, one of four inches, and eighteen feet deep was made, distant from the edge of the cliff about ten feet, into which one keg of powder was put and exploded as preliminary, and which had the effect to open a seam to the depth of fifty feet. Sixteen kegs of powder was then put in as a final charge, which threw down over 3,000 tons of ore, so completely broken up that the largest portion was small enough to load on the cars for shipment without further reduction.—*Marquette News and Journal*.

New York will soon be defended by eight hundred pieces of the heaviest ordnance. A gentleman who has recently passed through the large new fort near the Narrows, informs us that he counted fourteen guns described as three-hundred pounders, and that the bulk of the armament consists of twelve-inch and fourteen-inch guns. Platforms were being laid for fifteen-inch and twenty-inch guns.

## MEXICAN MINING ITEMS.

The schooner Mary Cleveland cleared, on Saturday, for Ventana Bay and La Paz, in Lower California. Her freight consists of machinery, lumber and mining tools for the Santa Cruz, La Marroneua and Pena silver mining companies in San Antonio District.

The mines in this District are of the most permanent character, and will compare favorably with the best of the Mexican mines; the ore being very rich, the mines wide and freight cheap to and from this city.

The District of San Antonio is fast filling up with California miners who have already developed about sixty mines; and as they have to rely upon the city of San Francisco for tools and machinery, the recent, numerous shipments of these articles to that place, and the heavy shipments of ore from there to Swansea and Freyburg, and the fine, large samples of rich lumps or specimens forwarded to this city, have made this stock much sought for in this market. The block of metal at 411 Clay street, sent up from the Marroneua mine, gives abundant evidence of the strength and permanency of that mine. Eastern capital, at the present time, appears to prefer Mexican mines to the less extensive and more unreliable veins in Washoe.

The Sierra Nevada, which cleared on Tuesday last, for Mazatlan, La Paz and Cape St. Lucas, took away not only six hundred tons of mining implements, but several of our most able metallurgists, who go to examine the northern mines in Sonora.

The most of the mines in Lower California and Sonora have passed into the hands of California capitalists within the last year, and many of them are now taking out large quantities of silver and have hundreds of tons of ore now ready for shipment. In Lower California the ore is Metal de Fuego, or fire metal, and it is found cheaper to ship it than to assess heavily for machinery to work it on the ground. We are warranted in saying that the lowest return of ores from Lower California to Frieberg was \$147 per ton, and the sum total of shipping, freight, working, commissions and extracting the ore is ten dollars per ton to take it out of the mine and place it at Ventana Bay, (18 miles from the mines); \$12 per ton from there to Frieberg; \$18 to work the ore in Frieberg; \$5 for railroad and municipal duties, and 1 per cent. commission—making \$46.50 per ton; leaving a clear profit of \$100 and upwards per ton, on the common ores, and much of it will double this sum in profit, as the late tests will show. Tests of the Triunfo, Guosane, Santa Cruz, La Marroneua, Maria, Picacho, San Antonio, Pena and Carozallita mines which have recently been made, yielded from three hundred to five hundred dollars per ton.

THE "DICK SIDES," or "Sides" as it is now generally denominated, have commenced suit against certain parties in Virginia City, who have "squatted" upon their ground, for possession of the same for mining purposes. The question of the occupation of mining ground in that city, for building purposes, is becoming a very embarrassing and important one. In the present instance, we are indirectly cognizant of the fact that a "written notice" was given to the parties who put up the first "squatter's improvement" upon their ground, that the company claimed, under the laws of the District, 100 feet on each side of their ledge, from stake to stake, for mining purposes, which claim was acknowledged by the parties in question, who owned the building that was subsequently known as the "Old Mormon Theatre," and who at the time agreed to remove the same whenever the ground was needed for mining purposes. A subsequent, possessory right of this description upon mining ground must be very precarious as the Courts have ever been liberal to miners in their allowance of ground for mining purposes, as indeed, they should be.

FRANKING.—No private citizen, high or low, can send a letter or document of any kind, or any other thing, to any officer or public man at Washington or elsewhere (excepting to members of the United States Senate and House of Representatives, the Secretary of the Senate and Clerk of the House of Representatives,) without prepaying full postage thereon, whether such matter is upon official business or otherwise. He must prepay letters to the President of the United States, his Cabinet officers and all others in public stations with the above exceptions.

No Less than seventy steam fire engines have been made up to this time by the Amoskeag Company, of Manchester, New Hampshire, including some for almost every city in the Union, two for Halifax, and one for the Russian city of Amoor. Where do not American inventions penetrate?

**BULLION.**—During the month of November Wells, Fargo & Co. shipped from their office in Virginia, \$746,751, weighing nearly twenty tons. It should be borne in mind in this connection that this is only about two-thirds of the actual value of the bullion shipped.—*Ter. Enterprise.*

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

**Emmett Copper Mining Company.**—Notice is hereby given that at a meeting of the Board of Trustees of the Emmet Copper Mining Company, held at their office, No. 523 Montgomery street, San Francisco, December 3, 1863, an assessment of twenty-five cents per share was levied upon each and every share of the capital stock of said Company, payable immediately in U. S. gold coin to the Secretary at the office of the Company, or to L. HONIGSBARGER, Copper-polis.

By order of the Board of Trustees.  
M. G. ELMORE, Secretary.

**Ruth Windsor Tunnel Company, Esmeralda district.**—Notice is hereby given that an assessment of fifty cents per share was levied on the capital stock of the above company on the 21st day of September, 1863, payable immediately to the Secretary at his office in United States gold coin.

By order of the Trustees.  
T. L. Bibbings, Secretary, 305 Montgomery St. San Francisco, October 13, 1863.

### Mining Shares For Sale

BY  
O. A. CRANE,

Office 28 Government Block.

- 475 Shares U. S. Mining Company, Virginia City.
- 910 Shares Granada Gold and Silver Mining Company Virginia Hill, Virginia City.
- 168 Shares Evoca Consolidated Copper Mining Company, Crescent City, Cal.
- 20 Shares Mohave Mining Company, La Paz District, Colorado, N. M.
- 30 Shares Aspinwall Gold and Silver Mining Company, Devil's Gate District, N. T.
- 75 Shares Washington Copper Mining Company, Indian Bar, Tulame County.
- 228 Shares Montezuma Gold and Silver Mining Company, Inyo District, Tulare Co.
- 90 Shares Owen's County Consolidated Gold and Silver Mining Company, Inyo District, Tulare Co.
- 50 Shares Crown Point Ravine Gold and Silver Mining Company, Virginia District, N. T.
- 10 Shares Triunfo Gold and Silver Mining Company, San Antonio District, Lower California.

Office of the Company No. 328 Montgomery street.

### REMOVAL.

OFFICE OF THE PACIFIC METALurgical Office is removed to 509 Sacramento street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.  
COPPER ORES—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent,  
509 Sacramento street, near Sansome.

### GENERAL NOTICES.

DR. H. AUSTIN,  
DENTIST,

No. 634 Washington street,

Between Montgomery and Kearny, (over San Francisco Baths.)

I have recently received from London a New and Beautiful Vulcunite (India Rubber) for Artificial Teeth, which is far superior to any other ever used. It is light, clean and durable, and of a natural color. The cheapest and best material for temporary (and in many cases) permanent sets. All operations thoroughly performed, and at reasonable prices. je-29

### DESKS

### GENERAL NOTICES.

### New Patent Agency.

WE HAVE CONNECTED WITH THE Publication of the "MINING AND SCIENTIFIC PRESS"

The Patent Agency Business, And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

Mining and Scientific Press Agency The most desirable place to make application for Letters Patent on the Pacific coast. Apply at

Office of the "Mining and Scientific Press," Room No. 57, Government House, corner of Washington and Sansome streets, San Francisco. EWER & SMITH.

### FOREIGN PATENTS OBTAINED

By application at this office, Room 57 Government House. EWER & SMITH, Solicitors.

### NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 57, Government House. Terms moderate. EWER & SMITH.

### PATENT RIGHTS.

Patent Rights Bought and Sold, At the office of the "Mining and Scientific Press" Agency EWER & SMITH.

### IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions Illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventor. EWER & SMITH.

### WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans have been in daily operation at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 2016-1f ZENAS WHEELER.

FOUNDRIES & MACHINE SHOPS.

**REYNOLDS' Patent Cut-Off and Governor, FOR STEAM ENGINES.**

127 of these Invaluable Machines, ARE NOW IN USE In California and Nevada Territory, giving a perfectly regular motion and Saving 20 to 65 per cent of the Fuel.

**Steen's Improved Governor** Is the CHEAPEST, SIMPLEST and QUICKEST to act and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street, San Francisco.

**Clark's Steam and Fire Regulator,** For controlling the Draft or Blast by opening the Chimney or Valve in the Blast pipe by the pressure of the steam in the boiler. It will regulate the pressure to a pound, on the square inch. It CANNOT get out of order and any person can put one up in an hour after the damper is put in.

**Ingersoll's Patent Drill Press,** With which drilling can be done the same as with the common ratchet, and when small holes are wanted, it can be done four times as fast. The handle can be worked in any direction.

**Felt for Steam Boilers, Pipes, Etc.,** At the lowest market rates.

**Steam Engines, Boilers, Pipes,** Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest market rates.

**Anti Incrustation Powder,** A Sure Remedy for Scale in Steam Boilers, without injury to the iron. In use for the past EIGHT years. Refer to—Sugar Refinery, San Francisco, Cottell & Co., San Jose, L. A. Booth, Esq., Virginia City, and 2,000 others in the United States. **E. T. STEEN AGENT.** No. 33 Fremont Street, San Francisco.

**PORTLAND BOILER WORKS.**

**MOYNIHAN & AITKEN,** Boiler Makers & Sheet Iron Workers, Mission, between Beal & Fremont Sts., San Francisco.

N. B. All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms. Jy 29

**PUMPS!**

**HARRISON'S California Lift and Force Pump,** WITHOUT VALVES OR PACKING, Suitable for Mines, Fire Engines, Wrecking or Irrigating. This is the Cheapest, Lightest and most Durable, and least liable to get out of order, of any Pump yet introduced.

**ALL SIZES;** Capable of throwing from ONE HUNDRED to FIVE THOUSAND Gallons per Minute—For sale by

**C. H. HARRISON,** PHOENIX OIL WORKS, 517 Front Street, San Francisco, Je 15

**50 lbs. MARINE and Fire-Proof Paint,**

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, on ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and little equal to Copper, no worms will ever effect it, and deeper than any other paint.

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil. For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**

HOUSE:—Mix three parts Mineral Paint with one part white lead, mix with Linseed oil: if a lighter color is wanted, mix less paint, more lead. ROOF:—Five parts of Mineral Paint, one part white lead, mix with Linseed oil. Put it thick on a tin Roof once coat when properly applied will last three years.

**HEPBURN & PETERSON'S AMALGAMATOR.**

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

**GOLD AND SILVER ORES,** manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machines now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver state Reduction Works, Yephly Flat Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

**Eye, Ear and Throat.**

**DR. DE CASTRO,** Oculist and Aurist,

**WHO HAS PRACTISED IN NEW** York and all the principal cities of Europe with such unrivalled success, and from each place is in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. De Castro, of long standing and thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**Self-adjusting Artificial Tympanum,**

For the relief of deafness, attended by lesser injury of the membrana tympani, and for the cure of discharge from the ear—the invention of Dr. Castro, M. D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November, 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the immense benefit a young lady friend of his had received from it. She was in fact, quite deaf, and in a most miserable state; the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Block street.

**Mr. Editor—Having been afflicted** with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearny and Market streets, and underwent one operation, and it was with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an aurist.

**JOHN REESE, Napa Valley** James Callaghan, witness, San Francisco, July 30th, 1883.

**[From the Daily Alta.]** San Francisco, June 30th, 1883

**Dr. De Castro:** Permit me through your widely circulated journal, to say, that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearney and Market Streets, and undergoing one of his direction, two operations, she has heard sound very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parents similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physician and aurists in California, but up to the period of visit to Dr. De Castro, received no benefit.

**CHAS JOHN P. WRIGHT,** 812 Green Street.

MINING NOTICES.

Notice is hereby given that by order of the Board of Trustees of the MAYFLOWER GOLD & SILVER MINING COMPANY, there will be sold to the highest bidder at the auction of Jerome Rice & Co., Montgomery St., on the 9th day of December, 1883, at 12 o'clock, M., a sufficient number of shares of the Capital Stock of said company, standing on its books in the names of the following persons respectively, to pay all assessments owed and unpaid thereon, on the 4th day of October, A. D. 1883, together with expenses of advertisement and sale.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. VII. SAN FRANCISCO, MONDAY EVENING, DECEMBER 14. 1863. NO. 7.

**ENLARGEMENT AND IMPROVEMENT  
OF THE MINING AND SCIENTIFIC PRESS.**

SATURDAY, JANUARY 2. 1863.

The publishers are pleased to announce the enlargement of this journal on the 2d of January next, from eight to sixteen pages—double its present size.

**NOTICE.**

The publication of the MINING AND SCIENTIFIC PRESS will hereafter be conducted by the firm of DEWEY & CO.

C. W. M. SMITH,  
W. B. EWER,  
A. T. DEWEY.

San Francisco, Dec. 1st., 1863.

**TERMS OF SUBSCRIPTIONS.**

Upon enlarging our sheet, we have determined to adhere strictly to the advance payment for subscriptions, and shall make only a slight advance on old prices. Our rates, hereafter, will be as follows:—For one year, \$5; six months, \$3. By city carriers, 50 cents per month.

**To Advertisers.**

The circulation of the Press throughout all the Mining Districts of this State and Nevada Territory, renders it a desirable advertising medium for Mining Companies, Inventors, Patentees, Machinists, Manufacturers, Builders and Tradesmen. Terms reasonable and uniform.

Advertisements for the first issue of our enlarged series, should be handed in at an early day.

**Sacramento Agency.**

W. B. RICE, at the book-store, 146 J street, between 5th and 6th, is our Agent for Sacramento city.

**Our Address.**

Parties addressing this office should be particular to write the name "MINING AND SCIENTIFIC PRESS" in full, to avoid all liabilities of mistakes.

**OUR NEW ARRANGEMENTS.**

By special notice it will be observed we have associated with us in the publication of the PRESS, Mr. A. T. Dewey, of La Porte, Sierra county, who has been connected with the *Mountain Messenger*, as publisher, for the past five years. We shall now be enabled to carry out our long cherished plan of enlarging the paper, and the friends of mining and mechanical industry may rest assured of soon receiving a journal in every way worthy of their representation and universal support.

**A DESIRABLE IMPROVEMENT.**—"Crocker's Stock and Assessment Ledger" is claimed to save Secretaries of mining companies a great deal of labor, and is a real assistance in keeping the accounts of shareholders from becoming complicated. The publisher's description will be found in our advertising columns, and a copy of the work can be seen at the office of the Press.

**A RARE CABINET OF MINERALS.**—We were well repaid for a visit to Dr. Jos. M. Frey's office, at Sacramento, in a brief examination of his rich and rare collections of minerals, which, in variety, is doubtless unsurpassed in the State.

**RIVERSIDE.**—This is the name of a new "city" just laid out in Keys' Mining District, Owen's River, ninety miles south of Aurora, and fifty miles above Bend City. Mr. C. C. Scott informs us that the mines prospect richer than those of the Inyo District, and that they are surrounded by rich and healthy agricultural lands.

**PILOT KNOB.**—A correspondent writing from "Pilot Knob" says that the Pilot Knob shaft is now down fifty feet, with high hopes of success at a depth of 100 or 150 feet. Our correspondent adds:—

"Too many around here get faint-hearted if they do not find copper near the surface. We prefer depth with continuation, to surface with pinching out and in. Many shafts are idle, awaiting the periodical excitement for more work. There is a fine development of two feet of rich ore in Johnston & Co's shaft, near the Aroyo Seco. They are persevering, energetic men, and deserve success. The Lima also is taking out ore; vein, I believe, 12 inches. Excitement has ruled high for a time, but sober business has now taken its place.

**REPORTED SILVER DISCOVERY.**—A correspondent writes from Mokelumne Hill, Dec. 5th, 1863, as follows:—I have just returned from the Stanislaus River, and vicinity of Melones, where I think another rich strike has just been made by a company of Greeks. While prospecting for copper they struck a vein, about four feet wide, yielding sulphurets of copper and green and blue carbonates of copper, in which there is a large proportion of silver. A piece of choice rock taken from a depth of two feet, produced at the rate of \$414 per ton, while an average lot produced \$302 per ton. This assay was made by our friend Dr. James Hepburn, of this place, and was made for silver only. In a few days I may give you a description of the place, and its ledges, for publication. The first chance I have I will send you a piece of this Greek rock for your cabinet. R. W. D.

**THE REESE RIVER QUARTZ MILLS.**—Correspondence, dated Austin, 28th of November, in the *Virginia City Union* says: There are three mills here in this cañon, and three more are being built; but they are pretty generally idle now, on account of the mill men and miners being at sword's points about the price of the crushing—\$100 per ton. The miners also say that the mills are not prepared to give proper return's as they have not a sufficient number of pans. Whatever may be the merits of the controversy, the disagreement exists, and its consequences have been injurious to the country, much retarding its development.

Much excitement exists in and about Salt Lake, owing to new discoveries of good deposits of the precious metals. Gold and silver bearing quartz has been found in several localities. The Mormons, or at least the head men of Brigham's tribe, are in nowise pleased at the "strikes" being made. Yet prospecting continues daily, whether they like it or not. The "Saints" fear a rush next spring of hardy miners.

The annual freight bill of the Central mill in Virginia city is, we are informed, about \$20,000. This is for salt, chemicals and such machinery and other things as the legitimate wear and tear of a mill make necessary.

The *Humboldt Register* says, something like two miles above Star City is found a limestone bluff, having a bold, square front, like the facing of a huge fort. In the face of this is the entrance to one of the grandest caverns ever yet explored. It has been partially explored.

**FOUR MASTED SCHOONER.**—An eccentric looking craft of this description is now freighting on the Sacramento river.

**SANTA CRUZ PETROLEUM.**—The Santa Cruz Petroleum Oil Works Company have worked wonders in the last two weeks. A road has been constructed to the Petroleum Hills, one building, designed as quarters for workmen is already finished; another, two stories high, and of larger dimensions, is almost completed. The brick, for boiler and engine, and for retort and still foundations, are already on the ground. If the rains do not very much interfere with the work, we shall illuminate Santa Cruz with oil from our own hills before spring.

The supply of petroleum and rock oil is giving out in the East. Many of the refineries in Pennsylvania and Canada have stopped work for want of the raw material to work upon. Crude Oil has advanced in price from \$1.50 to \$5 per barrel.

There seems, in many places, to be a sudden exhaustion of the great reservoirs of oil; sometimes however the springs are intermittent, and resume their flow after a short cessation.

The Santa Cruz Petroleum Oil Works Company will not be annoyed by any intermission or exhaustion of their supply of raw material. The petroleum is all above ground, and in quantity sufficient to last a century. If by boring they should reach a reservoir of oil, that would be clear gain.—*Santa Cruz Sentinel*.

**MINERS IN DEMAND IN SISKIYOU COUNTY.**—The *Yuba Journal* says that Siskiyou county is deficient in a supply of Mining hands, caused by the stampede to now places, and the dread of China competition. Miner's wages have increased twenty-five per cent., and mechanics' wages have also increased.

**THE RECENT ELECTION** in the Washoe Stock Exchange Board at Virginia resulted in the choice of R. M. Daggett, for President. R. W. Billett for Vice President. John McCarty for Secretary, and R. T. Smith for Treasurer, all of whom were elected by acclamation there being no opposing candidates.

**THE COMMERCE OF THE WORLD.**—It is stated that the commerce of the world requires 3,600,000 able-bodied men to be constantly traversing the sea. The amount of property annually moved on the water is from fifteen hundred to two thousand millions of dollars; and the amount lost by the casualties of the sea, averages twenty-five millions of dollars.

**CHICAGO WOOD PAVEMENTS.**—The Board of Works in the City of Chicago have given the preference to wood pavements over those of stone, as being the most durable of any kind yet used there. The following is a description of the method of construction: Lay down flooring of one inch board on a bed of sand; coat the floor with asphaltum; stand on end blocks of wood six inches high, by three inches thick, and nine inches in length, in rows about one inch apart, divided by strips of boards. Fill in these open narrow spaces with asphaltum. There are six miles of these pavements in Chicago, which after six years constant wear, are found to be nearly as perfect as when laid down.

[From our Traveling Correspondent.]  
COPPEROPOLIS.

MR. EDITOR:—In collecting information as I travel from mine to mine, I have noted down several matters, which I suppose, may be called abuses, because they are unjust to miners. These, I hold, your paper should recognize, and correct, or at least in justice to itself, endeavor to correct. One thing in particular, I find very injurious to the mines, and all classes with whom I have conversed upon it are anxious I should bring it forward.

Throughout this copper country, there are many claims having a local value from five to twenty-five dollars per foot. These prices, outside stockholders, men of business, and shareholders laboring on claims they own in, are content to pay, and do pay all the time. In fact, quite an amount of stock, after this fashion, is constantly changing hands.—At the same time *not one* of these claims could sell a foot at San Francisco for *as many cents*. Now this it seems to me is wrong, wrong in itself, wrong especially to the laboring miner. If men living in the neighborhood of a claim, or working a claim, are content to give ten dollars a foot, because they know it is worth the money, being a marketable article, it ought surely to be worth the same on Montgomery street. If the brokers choose to make San Francisco the centre of the mining market, they must at the same time assume the entire responsibility, and not dictate what shall, and what shall not, as their sovereign pleasure wills, be offered for sale to the public. If the country must be governed by San Francisco, in return, San Francisco should be just to the country. The present system is a curse rather than benefit to the mining interest.

Let me state a case in point. A company with limited means go down on their claim say seventy feet, and strike a vein which makes the stock worth ten dollars per foot in its neighborhood. They then require further means to prosecute their work, pay their bills and so forth. Money happens to be scarce in the country; San Francisco is closed against them, and so, much to their injury, work is suspended. Now, in such times of need, the centre of the Stock-market, if there is one, is precisely the place to go, being formed for that purpose, at least one would think so, but they may as well go to Jericho as there, for the market is not open to them. You may sell any other property when, how, or to whom you please, but your mining stocks you must get permission to sell. Such is the condition of many mines here, as you find by my reports—"work is suspended." Now, I cannot see that a change of system, by which means could be obtained to prosecute work, by a ready sale or hypothecation of reliable stock, necessarily opens the door to wild-cat stock. The "cooking" system is not practised here because simply the mines are good. All I contend for is that if a claim has a local value of ten dollars a foot, it ought for the same reason, and from the same cause, because it is worth ten dollars, to have the same value in San Francisco. For instance, the other night, a half-share in the Massachusetts sold here for \$1120. How much for the same could they get in San Francisco? Not a dollar, good as it is. I hope Sanborn, Berry, and other leading men will think this matter over. They may rest assured a change in this respect would be of immense benefit to the mining interest in the country, bring a safe and profitable business to the Bay, and put money in their own pockets. I think the brokers as regards this matter really are pursuing a suicidal policy. They have a world-wide reputation for generosity—ever free, open-handed, just. Were they a sordid, sharp, crafty, money-loving class, I should appeal to their cupidity. Those who sit on the miners' throne, should give some little heed to the miners' rights and wants.

The last mine I mentioned in continuing my report was the Colnor, some ten miles east of north from Copperopolis, near Altaville. We must now come back to Salt Spring Valley, and begin with the

#### KENTUCKY.

This claim contains 3,500 feet, divided into thirty shares. Main shaft eighty-five feet, with two drifts. The first drift, eighteen feet down the shaft, I did not see, but I am told it held good copper. A small vein was cut below, also, 75 feet deep, more west than they are now drifting, and to cut it again in a more easterly course is the object of the present work. This claim has had a good local value. The shaft, is sunk in serpentine rock, which in my opinion is not favorable. The Union lode, however, must run through the Ken-

tucky, so if they do not find it in this shaft they can in another. I was in hopes of getting some handsome specimens of asbestos here, but those left were poor. I send you two, one of each kind. The peculiarity of this rock consists in its being impervious to fire, and capable of being woven into cloth. It has long been used by the London Firemen, in cases of extreme need; and is, I suspect the great secret of the Fire-king of Frisco. I suppose the people have wearied of seeing him by this time and worship some other "curious thing," so I shall not injure his business by disclosing his secret. Continuing on some three miles we reach the

#### COMET.

This claim contains 3,750 feet, divided into 25 shares. Main shaft fifty feet, showing a well defined lead two feet thick, with walls about eight feet apart. Work suspended to put up machinery. The Comet is certainly on the Union lode, and will soon have a high value. A short distance from, parallel with the Comet is the

#### FRANKLIN.

It contains 4,500 feet, divided into thirty shares. Main shaft, 20 feet; nothing going on here at present. Indications good. Near the Franklin and parallel with it, is the

#### PLEASANT VALLEY.

It also contains 4,500 feet, divided into thirty shares. Shaft, thirty-seven feet, showing a small vein well developed. Work suspended until next Spring. About one-quarter of a mile east of these claims, at the foot of the hills, and parallel with them is the

#### BUFFALO.

This claim has also 4,500 feet, divided into thirty shares. Main shaft, sixty feet, with one drift twenty-five. Rock much torn and bolted by a slide. A small vein found. These claims show very plainly the four veins of the Copperopolis system. Next, up the valley three miles more, is the

#### SUFFOLK.

With 4,200 feet, incorporated. Main shaft, thirty-five feet. This claim excited great expectations at one time; but the rock now looks so contrary that I do not like to venture a prediction. There is much work to be done here. Nevertheless, indications of a vein exist. A mile further on comes the

#### CALEDONIA.

This claim contains 3,000 feet, divided into 3,000 shares. Main shaft, 105 feet. The Caledonia will shortly be one of the principal mines of the valley. The vein opens well at the top, and goes down regularly increasing to the bottom where it is twenty-two feet thick. The veins at the present consists entirely of mundic, and may change any day to copper. A change in the rock is very perceptible now. If they do not have a big thing here, I know not where they will find it. An excellent engine from Coffey & Risdon of the Bay, has just been put up, making the works very complete. Mr. Brown and Capt. Frost showed me every attention. Proceeding still some miles, to the north of Stockton and San Andreas road I finish the mines on the Copperopolis lodes, and leaving the Salt Spring Valley, come into the Spring Valley District. First here, is the

#### JEFFERSON.

It contains 2,800 feet, divided into fourteen shares. No work going on at present, the owner paying so much to the Forty-nine, as one shaft will develop both claims. A very good and prudent arrangement.

#### THE FORTY-NINE.

It contains 3,000 feet, divided into 3,000 shares. Main shaft, fifty feet. This mine is eventually going to stand high. When down 100 feet, the rock will lose what little corruption it bears at present, and show a strong vein. It contains good yellow sulphurets now. On the east of these claims a few yards is the

#### LIBERTY.

It contains 2,800 feet, divided into fourteen shares, with two shafts, fifty and forty feet respectively. In the former, the indications are good; the rock carrying strong sulphurets. In the latter the vein dipped out with such an inclination that a third shaft will be required. Again, west of these, between three and four hundred feet, but parallel with it, is the

#### POCAHONTAS.

It contains 2,800 feet, divided into fourteen shares. Main shaft, fifty feet; which has been put down principally by one man working alone, Mr. Gaffneff, formerly a liquor dealer in San Francisco, and a large loser by the Cariboo excitement.

It is the most striking and creditable instance of individual pluck that I know of. I thought at one time that it was all lost labor, but a closer examination shows me I was wrong, and that the old gentleman has a right good chance. He drills and blasts alone, timbers alone, hoists alone. If he does not deserve a good reward, who does?

I staid all night at the Briant House, kept by a gentleman of that name, and which is certainly one of the best road-side hotels I know of in California. The next morning Mr. McKeon accompanied me round. He is largely interested in copper, and has made himself well acquainted with the Copperopolis veins. We visited first the

#### CONSTITUTION.

This claim contains 2,800 feet, divided into fourteen shares. Work just commenced with excellent croppings and openings. It is two miles east of the line of the Union, and appears to a swer to the course of the Crockett. Something over 100 yards east from this is the

#### SPRING VALLEY CO.

This claim has 5,000 feet, divided into 250 shares. Main shaft fifty feet, with vein well developed. One hundred feet ought certainly to give good copper. Next is the

#### BUENA VISTA.

I find I omitted the dimensions of this claim. It is a continuation of the Constitution though two miles from it. The indications and croppings here are really magnificent. The Buena Vista is located on a very high hill on the south side of the Calaveras, giving a glorious view of the whole country. Recrossing the river, and going west of north some two miles we found the

#### SAM BOOKER.

This claim is named after Gen. Booker of Stockton. It contains 2,800 feet, divided into fourteen shares. Main shaft 107 feet deep. The vein opens well, I understand, at the bottom. The rock carries abundance of mundic, and looks well. Work suspended until next Spring. My own opinion is this will be a good claim. From here we rode quite a distance to Mr. Pattee's hotel, where we were very politely received, and proceed to the

#### JACKSON.

This claim contains 4,600 feet in 200 shares. Main shaft forty feet deep. The vein well developed at the bottom. The rock is pure, carrying mundic and yellow sulphurets. Depth only is required here to have an excellent mine. I have to apologize for not visiting the "Sylvester," another claim near the Jackson, as I promised to do so the next morning. I beg to state I could not find it. I proceeded then to Mr. Coles of the North American House, another excellent hotel, eight miles lower on the Stockton road, where I met friend Weihe of Stockton who was up on a shooting trip. I was happy to hear from him that the Stocktonians are well pleased with our efforts. After dinner we all drove out together to see the

#### YOUNG AMERICA.

This claim contains 6,600 feet in thirty-three shares. Main shaft 140 feet, showing a good opening, and a strong vein all the way down. The work is well done, though the shaft is a little too small. The rock at the bottom in spots is peculiar, being soft as if slacked by lime. It carries an immense body of mundic, with large thick veins of yellow sulphurets through it. I told Mr. Cole they might strike the vein at any hour, and at Jenny Lind two days after I understood they had done so, and to use a common mining expression "struck it good." If they have not they soon will. This claim is on the Gopher system, and before long will stand high.

Here closes the Salt Spring Valley and Spring Valley mines. Taken altogether they look very well. I have now only the Jenny Lind and a few others on the road back to Copperopolis to report upon, which I will "write up" without delay.

L. H.

GEOLOGICAL SURVEY OF GREAT BRITAIN.—The Geological Survey made considerable progress during the last year; two thousand four hundred and thirty square miles were surveyed in Great Britain; the publication of the maps proceeded, and memoirs were issued illustrating the geology of the Isle of Wight and the country around Bolton-le-Moors. In Ireland the new ground examined amounted to about one thousand and twenty-eight square miles; four new numbers explanatory of the maps were issued. The surveyors were also engaged on the re-examination of the districts of igneous rocks running from Wicklow into Waterford.—*London Mining and Smelting Magazine for October.*

**THE AQUILA.**—If the New York Board of Underwriters are wise they will close with the proposition of responsible parties in this city, who have offered to undertake the raising of the *Aquila* for \$150,000 in gold. This party offers to save the *Aquila*, if it is practicable, and to guarantee the safe raising of the *Comanche* under any circumstances. If necessary, they bind themselves to build a coffer dam entirely around the wreck, and pump it out within a given time. The answer of the Underwriters is not yet received.

That the cargo of the *Aquila* can be saved beyond a peradventure, is a matter that can scarcely admit of a doubt. The ship lies directly alongside of a substantial wharf, with her stern some ten feet out of water, and her bow thirty feet under water. It is a matter of the utmost astonishment that a party of wreckers, with suitable diving apparatus, has not long since been set to work to take out the cargo of this ship, by taking off her decks and raising the cargo piece by piece. If danger from storms is apprehended, there are various ways that she may be rendered perfectly secure in her present situation.

The trouble seems to be that nobody appears to own her—she being held by these parties in interest—the Government, the Underwriters and the Contractors—each disclaiming any positive controlling ownership, and each asserting that she is in the hands of the other. The contractors have evidently made a losing speculation, and have apparently nothing to gain by moving any further in the matter. The Government has advanced \$340,000 on the *Comanche*, which amount is fully covered by insurance, and therefore has nothing to lose pecuniarily, as the matter now stands. The amount of insurance affected by the contractors, does not appear, but at all events the underwriters do not seem disposed to accept an abandonment. Thus it appears that the city of San Francisco, with all her valuable commercial interests, are to be kept in jeopardy for an indefinite time, while these several parties are endeavoring to settle their dispute with regard to title. It is earnestly to be hoped that the Government, if neither of the other parties can agree in the matter, will step in, and in some manner close a contract with the San Francisco company above alluded to, so that this much needed security to our harbor and coast may be raised, set up and made ready for duty at the earliest possible moment. This work cannot now be done much inside of a year at best. Had this unfortunate accident not occurred, from five to six months only would have been required to have put the *Comanche* afloat.

## DR. DE CASTRO, Oculist and Aurist,

**WHO HAS PRACTISED IN NEW YORK** and all the principal cities of Europe with such unrivalled success, and from each place is in possession of the most eminent testimonials, may now be consulted upon diseases of these delicate organs, with a view to their permanent cure. Deafness of long standing thoroughly cured. The Doctor employs his (by the Medical Society of London approved)

**self-adjusting Artificial Tympanum** For the relief of deafness, attended by loss or injury of the membrana tympani, and for the cure or discharge from the ear—the invention of Dr. Castro, M.D., author of "Deafness Practically Illustrated as to its Nature and Treatment," etc.

The self-adjusting Artificial Tympanum was first introduced to the notice of the profession at the meeting of the Medical Society of London, on the 20th of November, 1863. An animated discussion ensued on the reading of the paper, and several members of the Society bore testimony to the success of the remedy and the importance of the original discovery.

Mr. Baker Brown (member) bore testimony to the Self-Adjusting Artificial Tympanum, as he had observed the famous Countess de Montebello, who had received from it. She was in fact, quite deaf, and in a most miserable state; the effect of the tympanum was instantaneous—quite like a miracle. Five more testimonials from Members of the Medical College, New York, and the principal cities of Europe.

Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Entrance on Market street.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

### METHOD OF CRUSHING ORE.

The BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which the mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery, weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,

## PEOPLE'S OPPOSITION Steamship Line!

Special Notice.—The Steamers of this Line have been withdrawn from the Nicaragua Route until further notice.

### GREAT REDUCTION IN RATES !!

The Fast and Favorite Double Engine Steamship,  
**MOSES TAYLOR,**  
J. H. BLETHEN.....COMMANDER  
Will be dispatch for PANAMA  
From Mission street Wharf.  
**WEDNESDAY, - DECEMBER 23, 1863.**  
Punctually at 9 o'clock, A. M., on  
Connecting at Aspinwall, by the Panama Railroad, with the Splendid Steamship  
**ILLINOIS**.....2500 Tons.

The Moses Taylor, since her last trip has undergone the most extensive repairs. Her decks have been extended forward and aft; cabins enlarged, refitted and repainted throughout—making her accommodations equal to any Steamer on the ocean.

For further information or Passage, apply to  
I. K. ROBERTS, Agent,  
No. 407 Washington Street, San Francisco,  
Opposite the Post Office.

## BOOK KEEPING, Penmanship

AND  
**COMMERCIAL CALCULATIONS,**

**PRACTICAL ACCOUNTANT,**  
305 Montgomery Street, Corner of Pine.

### TO QUARTZ MINERS.

All persons interested in Mining Machinery are invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates. A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry called "Winchler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured.

TAY, BROOKS & BACKUS.

## REESE RIVER CORRESPONDENCE.

AUSTIN, December, 1863.

EDITOR MINING PRESS:—Since writing my last communication, I have stood a "Looker on in Venice," waiting for events to settle down into some tangible shape, whereby I might give your readers the true status of things, as received on the ground. The condition of the mills here is not entirely satisfactory, as but one in the canon, has been in operation during the past week, the rest are being housed or inclosed as fast as possible. I may make an exception in the case of one, which seems laid by entirely for the winter, with only a temporary shed over the boilers and machinery.

## AMADOR DISTRICT.

The chief attraction, the centre of all, as I may say, is turned to the Amador District, at the foot of the Eastern range of hills, skirting the valley of the Reese River, several miles north of Clifton. This is not a distinct district, but called so to designate its locality. About six weeks ago, the Amador ledge was discovered and as the work on it progressed, revelations of great promise were developed until the whole population became wild with excitement, and now, I doubt if there is a miner or an individual who could get away, who has not been over there with his pick and shovel prospecting. A town has already been laid out, called Coral City, and buildings are being put up as fast as lumber can be had.

In the canon, this side, I was told to day, machinery for a five-stamp mill, had arrived on the ground, and would be in operation as soon as it would be possible to put it up. While there is plenty of water, it is to be regretted that there is a deficiency of wood in and around that locality. The nearest considerable woodland, is eight miles up the same range of hills, or in sight across the valley of the Reese river, twelve or thirteen miles distant, in what is called Ravenswood district.

## THE AMADOR MINE

Is located on a gentle incline, facing the West. The ledge has been opened twelve feet below the surface, exposing a finer quality of quartz than in other districts, full six feet wide, tinted throughout with the blue sulphate of copper, and holding somewhat plainly, bi-sulphuret of iron, with some show of horn silver and bromides. I have yet to see the first man to speak unfavorably of it. This, together with my own information, induces me to pronounce it a first class mine.

## OTHER MINES.

Every claim taken up, in that district from which I have seen specimens, seems to be of the same classification of rock peculiar to this district. The Gen. Banks, another mine located on the same incline, two hundred feet below the Amador, running parallel and directly in front, is highly spoken of, and is said to be equal, if not superior to the Amador both in quantity and magnitude. From personal observation, I cannot speak of its vastness, as it was not stripped when I was on the ground, though I can pronounce it to all appearance nearly the same in richness.

Other mines have been taken up; indeed, the whole mountain has been run over, and wherever any indications were exhibited they were taken up at once, and, from appearances, with promise of a rich reward.

Unfortunately for mines outside of the charmed circle, they do not seem to provoke any inquiry, probably not that they are worth less, but the new mines, more.

## DESPERADOES ABOUT.

We are having a rehearsal of the times of your city before the days of the vigilance committee, wherein life has no security or protection, and it is seriously contemplated to adopt the same course of procedure, to rid ourselves of a class of murderers who regard human life as a plaything for their bravadoism and courageous (?) exploits. It was but a day or two since that two men were shot dead and the third mortally stabbed.

## CONFIDENCE IN THE MINES GENERALLY.

With all the drawbacks we have with the mills, I do not see that the confidence in the hidden wealth of this section, is the least abated. With the best mines, I do not see any lack of progress in their development. This surely indicates no discouragement and should prove the full faith in the integrity of the mines, by capitalists and others, most interested in their development, and ultimate success. It is probably

true, that many claims have been taken up and forced upon the market by sharpers, whose specific object was to fill their pockets, and then let the burthen fall upon their dupes; also that many with honest intentions, have embarked in the same enterprise and found they had mines not worth the powder to blow them up.

## HEEDLESS INVESTMENTS.

I have often wondered how a business man, who would not purchase a peck of beans without first examining them, or pass over money without balancing the equivalent well and long; is so ready to accept any man's "ipse dixit" when it applies to mines, and pay over thousands at the sight of rock studded with metallic globules, containing but a small percentage of silver. Take any other species of property, and the voucher of a saint will not answer his purpose. He must see for himself, and study the probabilities of a return from his investment. Let him apply this attention in his choice of mines and he will have less regrets to burden his soul, and more money in his coffers. If a man wishes to invest in mining speculation, and his attention is called to any particular locality, he has ample means to know what he propose to purchase, even though he cannot visit the mine himself. Thro' agencies established in almost every district, a pretty fair conclusion can be formed, corroboratory, at least, as it should be, of the representations upon which he originally proposed to purchase.

## SACRAMENTO.

The persistent and indomitable energy characteristic of Californians is strikingly illustrated by the recent accomplishments of our Sacramento neighbors. Doubtful if there is upon record the example of any community that have been so repeatedly impoverished by misfortune who have so promptly rebounded and risen to prosperity. Eighteen months ago one could see no encouragement or but little hope for the city to sustain her greatness, but now her darkest days seem passed, and with newly graded, gravelled and planked streets, mammoth levee, State Capitol and Pacific Railroad, she appears again upon the broad track of prosperity. The foundries, machine shops, and various manufactories have been enjoying an unusually flourishing season.

## THE LEGISLATURE

Organized in both branches promptly and harmoniously on Monday, the first day of the session. Tuesday the Senate met the Assembly in joint convention and canvassed the vote of the State Election. The vote for Governor sums up 108,905, Mr. F. F. Low receiving 64,283 and J. G. Downey 44,622. Mr. Machin, for Lieut. Governor, received a majority of 20,950 over McKinstry.

The Inauguration of Governor and Lieutenant Governor took place at noon, on Thursday, in the Assembly Chamber, after which Mr. Low delivered a very sensible address, in a plain, pleasing manner. A substantial military display was one of the features of the day, and a splendid ball was held at Agricultural Hall in the evening.

## SOBER INTELLIGENCE.

In appearance our State officials show an improvement in favor of sobriety and intelligence, and cold water will doubtless preponderate in Sacramento this winter, without the aid of floods. The Legislature have exhibited an appreciation of useful knowledge by giving the MINING AND SCIENTIFIC PRESS a liberal subscription list in both Houses.

## THE LOBBY.

The "Third House," of which (as a brief member) we must speak modestly, has sadly degenerated in numbers but highly increased in respectability.

## THE LEGAL TENDER ISSUE.

The question of the repeal of the Sanderson contract bill of last session, is likely to become a prominent one, and from the sentiments we heard expressed by various members, we think the chances are in favor of its nullification. The grounds assumed by those in favor of legal tender circulation is that thousands of dollars are now coined by importers and wholesale dealers through the premium on gold, and consequently consumers are holding on to the short end of the stick; and further, that the bill is an indirect discountenance of the Government's treasury notes as legal tenders, not particularly complimentary to the patriotic reputation of Californians. The matter will certainly be ably canvassed.

REESE RIVER ITEMS.—The following paragraphs are from the *Reveille* of Dec. 3d:

ANOTHER MILL.—The machinery for another quartz mill, to be run by water, owned by Hon. T. G. Phelps, has been deposited on the site selected for it, at the lower end of Lander City, on Big Creek. We like to see these evidences of the faith of mill men in the richness and permanency of our mines.

TIERNAN & Co's mill, Lander City, will be ready to run shortly. The batteries have not arrived as yet, on account of some delay on the road, but a large arrasta has been built, and the pans put in order, which will be used for crushing and amalgamating until the batteries can be placed upon the ground. A large quantity of Great Eastern rock is at the mill, ready for crushing.

THE AMADOR.—Near fifty men are daily employed on this ledge, stripping it, running a tunnel, etc. If this energy is continued during the winter, the Amador will, by spring, be in a very advanced stage of development, and an immense amount of rock will be ready for crushing. We are pleased to see such enterprise. If all our mines could or would exhibit such, it would require only a few mouths to develop to the satisfaction of all, the vast riches of this region.

FROM HUMBOLDT.—Charley Barber, from Sierra District, has shown us a very pretty silver brick taken from ten lbs. of rock from the Eclipse Series. He gives encouraging accounts of the progress of mining development in Humboldt. He feels fully confident that that region will be shipping large quantities of bullion inside of two years.

OWEN'S RIVER.—A gentleman writing from Owen's River to the *Aurora Times*, says: "that country will no doubt prove to be as rich in gold and silver as any yet discovered. The Slate, Russ, White Mountain, Inyo, Coso, and Slab Range, are all rich as far as prospected. The San Carlos Company are pushing their work ahead, and will soon have their mill ready to commence crushing rock. Bend City is getting to be quite a large place; also, San Carlos. There are families coming in every day, and settling up the vacant land. There is plenty of as good land here as I ever saw in any country, and I think this will, in a year or two be one of the finest places on the Pacific Coast."

## MINING SHARE MARKET.

The Mining Share Market, for the past week, has been characterized with extreme dulness, and quotations, as a general thing, have fallen off. Chollar, Sierra Nevada, Daney, Grass Valley and Wide West have each met with slight improvement; while the Ophir, Gould & Curry, Burning Mountain, North America, Lady Bryan, El Dorado, Chihuahua and Western Summit, Utah, Sheba, Melones, Justice and several other minor stocks have fallen off from last quotations. An unusual amount of assessments, recently levied upon several prominent mines, has contributed in part to this depreciation. The ardor of speculators has become very much dampened of late, while outside buyers are much more wary than formerly and much less inclined to invest at any price.

Gould & Curry has been more in favor during the past week, with very little offering. Offers of \$4,450 have been freely made, without finding sellers, although we notice a single transaction at that figure. This is \$50 less than last week's figures. Dividends for the month have been freely sold at \$140. Remittances of bullion from this mine for the week, have exceeded any previous similar period.

Ophir shares have been dealt in to a less extent than for several weeks previous, and at prices generally about \$25 less than last quotations. Notwithstanding the increased dividend, (\$60 per foot) declared last Monday, dividends for the current month have been sold at from \$40 @ \$45.

Uncle Sam is considerably sought after at about last quotations. It has changed hands during the week at from \$430 @ \$440. But few transactions are reported, holders being generally firm. Accounts from this mine are highly encouraging. The company has a large amount of very fine ore already out, and are constantly raising more. They have an 80-horse engine just arrived upon their grounds and are busily engaged in putting up a substantial engine house.

Potosi is quiet, owing probably to the announcement of an assessment of \$50 per foot. It is said that the present indebtedness of the Company is small but that further outlays will be soon required in the thorough development of the Company's mine.

Savage is well maintained, and favorably regarded by per-

The Office of the MINING AND SCIENTIFIC PRESS, has been removed to Rooms Nos. 56 and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing more room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented in securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

### A New and Valuable Book.

**Process of Silver and Gold Extraction,** by Guido Kustel, Mining Engineer and Metallurgist, former manager of the Ophir Works, 803 pages octavo illustrated.

This admirable work has met with the highest commendations from the Press and Scientific men, as a clear and able exposition of the science as practiced in California and Nevada Territory—it is written for the people in good plain English and finely illustrated.

Price—post paid—Cloth \$6; Sheep \$7.

JOURNAL and other Turbine Water Wheels with latest improvements.

[From the Daily Alta.]  
San Francisco, June 30th, 1863

ED'S DAILY ALTA:

Permit me through your widely circulated journal, to say, that my daughter Mary Ellen, has been afflicted with deafness since she was thirteen months old, and that she has been a member of the Deaf and Dumb Institute since it was organized. On taking her to Dr. De Castro, on the corner of Kearney and Market Streets, and undergoing under his direction, two operations, she has heard sound very distinctly; and is now, I am happy to state in a fair way to get permanent relief. The result, thus far, is satisfactory; and I deem this notice due to Dr. De Castro for his skill; and would recommend all parties similarly afflicted to give him a trial. My daughter has at different times been under the care of the most skillful physician and artists in California, but up to the period of visiting Dr. De Castro, received no benefit.

CHAS JOHN P. WRIGHT,  
812 Greco Street.

**Mr. Editor**—Having been afflicted with deafness for the last two years, originating from a severe cold, and for the last month suffering from the most excruciating pains in my ear, I was obliged to come down to San Francisco to seek relief. After a physician's recommendation to wait on Dr. De Castro, on the corner of Kearney and Market streets, and underwent one operation, and it is with the utmost pleasure I can say my hearing was suddenly and without pain entirely restored. I deem it my duty to make this known to the public, and to recommend Dr. De Castro's skill as an earist.

James Callaghan, witness,  
San Francisco, July 30th, 1863.

**Ruth Windsor Tunnel Company, Esmeralda district.**—Notice is hereby given that an assessment of fifty cents per share was levied on the capital stock of the above company on the 21st day of September, 1853, payable immediately to the Secretary at his office in United States gold coin.

By order of the Trustees  
T. L. Biddings, Secretary, 305 Montgomery St.  
San Francisco, October 13, 1863.

### GENERAL NOTICES.

DR. H. AUSTIN,

DENTIST,

No. 634 Washington street,

Between Montgomery and Kearny, (over San Francisco Baths.)

Patent Rights Bought and Sold. At the office of the "Mining and Scientific Press" Agency EWER & SMITH.

#### IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office have their Inventions illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to all them in introducing their inventions to the public will be found a most important advantage to inventors. EWER & SMITH.

### WHEELER'S

#### Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to flow the triturating loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained the large percentage of metals over its competitors, as well as an still larger percentage in the amount of work performed.

\*.\* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 2016-11 ZENAS WHEELER.

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

FOUNDRIES & MACHINE SHOPS.

THE MINES OF MEXICO.—The Echo du Pacifique, in an article on the mines of Mexico, says:

"It is necessary to give the Americans their due. No nation in the world has such an enterprising and adventurous spirit. When we look at the present development of the Mexican mines, and when we consider the past, we are astonished at the listlessness of one people and the audacity of the other. Some of these mines which for generations have remained in oblivion, or have been buried under the mass of ruins which had gathered in them, or have been filled with water, are now re-opened and worked at a profit. The indifference of the Mexican yesterday makes the wealth of the American to-day. The ambition of the American, his pride, and his sovereign contempt of everything but himself, may alienate the affection of other nations, but it is not the less true that wherever he goes fortune accompanies him, life expands and abundance reigns. Certainly his manners and laws do not please everybody; but it must be admitted that nature has gifted him with exceptional qualities, and that he is indeed the man for our new countries. In his hands the mines of Mexico will exhibit a wealth not yet suspected by the world."

ROTHSCHILD has taken four million pounds sterling of French treasury bonds at five per cent. interest—the whole loan is \$60,000,000.

COLT'S ARMY in Hartford made a gun a minute, for ten hours a day, during the month of October.

PATENT CLAIMS.—We will furnish, on application, the claim of any invention that has been patented within the last fourteen years. The name of the patentee—date of patent, when known, and two dollars for copying should be sent.

MODELS.—Inventors will please attach to all models sent to us, their names and address, in a legible, permanent form, this will avoid confusion and prevent errors.

DRAWINGS.—We have highly talented and efficient draughtsmen, by whom drawings of every description are executed in the best style of art, with promptitude and at a moderate cost.

#### WANTED

By a competent person, the Secretaryship of four Mining Companies. Books to be kept at the Office of the Mining and Scientific Press, No 57 Government House inquire as above. oct5

### MINING & SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

#### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patents with dispatch.

#### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with a large amount of readable matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

#### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

To Chemists, Architects and Millwrights. This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Names can be sent at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

Room 57, Government House, Corner of Washington and Sansome streets, San Francisco.

## REYNOLDS'

Patent Cut-Off and Governor, FOR STEAM ENGINES.

127 of these Invaluable Machines, ARE NOW IN USE In California and Nevada Territory, giving a perfectly regular motion and Saving 20 to 65 per cent of the Fuel.

### Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to act and most liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street, San Francisco.

### Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to pound on the square inch. It cures get-out of order and any person can put one up in an hour after the damper is put in.

### Ingersoll's Patent Drill Press,

With which drilling can be done the same as with the common ratchet, and when small holes are wanted, it can be done four times as fast. The handle can be worked in any direction.

### Felt for Steam Boilers, Pipes, Etc.,

At the lowest market rates.

### Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest market rates.

### Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury to the metal. In use for the past eight years. Refer to—Sugar Refinery, San Francisco, Cottrell & Co., San Jose, L. A. Booth, Esq., Virginia City, and 2,000 others in the United States. E. T. STEEN AGENT. No. 33 Fremont Street, San Francisco.

## PORTLAND BOILER WORKS.

## PUMPS!

HARRISON'S

California Lift and Force Pump,

WITHOUT VALVES OR PACKING,

Suitable for Mines, Fire Engines, Wrecking or Irrigating. This is the Cheapest, Lightest and most Durable, and least liable to get out of order, of any Pump yet invented.

ALL SIZES;

Capable of throwing from ONE HUNDRED TO FIVE THOUSAND Gallons per Minute—For sale by

C. H. HARRISON,

PHOENIX OIL WORKS,

Je-15

517 Front Street, San Francisco.

50 lbs. MARINE and

Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

#### DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil. For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire-Proof, and costing less than any paint.

#### DIRECTIONS:

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead. ROOF:—Five parts of Mineral Paint, one part white Lead, mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

## CROCKER'S

STOCK AND ASSESSMENT LEDGER.  
Copyright Secured—Price \$10.

The necessity of a proper book for keeping the Stock and Assessment accounts of Corporations has long been very much needed. One that would combine economy and simplicity, and would not require the services of an experienced book-keeper to keep the accounts correctly. CROCKER'S STOCK AND ASSESSMENT LEDGER has met this requirement; we have submitted it to several Secretaries of corporations, and they acknowledge that the plan is admirable, and just what has long been wanted. The printed headings are a perfect explanation of the manner of keeping it; and any person, whether they understand book-keeping or not, cannot make an error in the accounts. The Stock and Assessment accounts are so arranged that the Secretary can in a moment tell how any stockholder's account stands, both in regard to Stock and Assessments. He can also, with the greatest ease, trace any certificate, through any number of transfers, to the original one issued. It saves a great amount of labor, as it does not require one-fourth the writing of the ordinary method. It dispenses entirely with the old style of Stock Ledger, Stock Journal and Assessment Book, all three of which Secretaries have heretofore been obliged to keep, consequences of the whole in one book. A person who is Secretary of several companies, this book will prove invaluable, and we feel no hesitation in guaranteeing satisfaction to those who may order them. Specimen sheets sent to those who desire to examine it. The books are ruled with one or two accounts to the page. State which is preferred.

Published and for sale, wholesale and retail, by  
**H. S. CROCKER & CO.,**  
Book and Job Printers, Sacramento.

## Certificates!

And complete sets of books for Corporations, in the finest style, at short notice, and low rates. 7-1m

## MINING NOTICES.

**Enterprise Copper Mining Company.**—Office 528 Montgomery street, San Francisco. At a meeting of the Board of Trustees of this company, held December 12th, an assessment of ten cents per share was levied, payable immediately, and another assessment of eight cents per share, payable January 1st, 1864, and another assessment of eight cents per share payable February 1st, 1864, all payable in U. S. gold coin, to Thomas S. Levy, the Treasurer, at Lincoln, Placer county, or to the Secretary, at the office of the Trustees.  
By order of the Board of Trustees.  
7-1 feb1 M. G. ELMORE, Secretary.

**Wide West Copper Mining Company.** Office 528 Montgomery street, San Francisco, December 12, 1863. Notice is hereby given that assessment No. 2 of twenty-five cents was this day levied on each and every share of the capital stock of the Wide West Copper Mining Company, payable in U. S. gold coin, to the Secretary at the office of the Company, or to J. M. PIKE, Superintendent, Copperopolis.  
By order of the Board of Trustees.  
7-1m M. G. ELMORE, Sec.

**Emmett Copper Mining Company.**—Notice is hereby given that at a meeting of the Board of Trustees of the Emmet Copper Mining Company, held at their office, No. 528 Montgomery street, San Francisco, December 3, 1863, an assessment of twenty-five cents per share was levied upon each and every share of the capital stock of said Company, payable immediately in U. S. gold coin to the Secretary at the office of the Company, or to L. HONIGSBARGER, Copperopolis.  
By order of the Board of Trustees.  
6-1m M. G. ELMORE, Secretary.

**Mammoth Consolidated Gold & Silver Mining Co.,** Excelsior District, N. T.—Office 528 Montgomery St., San Francisco, Nov. 28, 1863. Notice is hereby given: there will be sold at Public Auction, at the office of the Company, in San Francisco, on Saturday January 9th, 1864 at 12 o'clock, M. of that day, to the highest bidder for cash in U. S. gold coin, so many Shares of the Capital Stock of said Company standing in the names of the following shareholders as will be necessary to pay assessment No. 1, of ten (10) cents per share, duly levied thereon by the Board of Trustees on the 9th of May, 1863; also assessment No. 2, of thirty (30) cents per share, duly levied thereon by the Board of Trustees on the 27th of June, 1863, together with all the expenses of advertising and sale, unless and a second assessment are previously paid to M. G. Elmore, Sec., San Francisco, or to W. H. Dalrymple, Financial Sec., Aurora. Names No. Cert., No. Ass't., Shares, Am't.

## HEYER &amp; CO.,

IMPORTERS OF

AMERICAN AND EUROPEAN

Fancy Goods, Toys & Musical Instruments; also,

COATS, PERFUMERY, HAIR AND TOOTH BRUSHES,  
Port Folios, Portmanteaus, Ladies' Bags, Photograph  
Albums, Cutlery, Willow and Parian Ware, Children's  
Carriages, etc., Our Stock of Violin, Guitar and other  
Strings is very large. Our Foreign Goods are selected  
by one of the firm, and the American by the Boston  
House (established 1824.) We have the Sole Agency for

**Hallet & Davis' Boston Pianos,**  
**Smith & Bros' Harmoniums, and**  
**Treat & Linsley's Melodeons.**

The Hallet & Davis Pianos are each supplied with their  
Patent Suspension Bridge, which is a decided improvement.  
It gives a full and clear vibration in the upper  
octaves, producing a quality of tone unequalled in firmness  
and purity. Our Melodeons and Harmoniums are of  
the best quality, and warranted to give satisfaction. 3m

## AGENTS WANTED.

We want a good Agent in every city, town and settle-  
ment, on this Coast. Applicants will send their names  
with reference, when specimen numbers of the **Min-  
ing & Scientific Press** will be forwarded to them,  
and their names added to our published "List of Agents."  
EWER & SMITH.

## Owens River Canal Company.

FOR SALE,

FOR ACCOUNT OF THE COMPANY, 7,000 SHARES OF  
the above stock, at \$1 per share. It is cordially  
presented to the public as the best investment, for the  
price, now offered in this market.  
Office of the Company No. 328 Montgomery street.

## REMOVAL.

**OFFICE OF THE PACIFIC METAL**  
urgical Office is removed to 509 Sacramento street  
Having enlarged our Works at North Beach, we are  
now enabled to reduce from 10 to 15 tons of Silver or  
Gold rock per day.  
Gold and Silver ore, and Sulphuret Assayers', or Sil-  
versmiths' sweepings reduced or purchased.  
COPPER ORES—Highest market rates advanced in  
cash, for shipments. S. C. BRADSHAW, Agent,  
509 Sacramento street, near Sansome.

and  
REDUCTION WORKS

Are prepared to work Gold and Silver ores, in large or  
small quantities.

Working assays made of small lots, and all kinds of  
ores crushed at short notice.

Our new and complete Machinery, will enable us to  
give results fully up to the merits of rock.

WHEELER & THAYER, Proprietors.

C. C. JONES, Amalgamator

San Francisco, Oct. 18, 1863.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. VII. SAN FRANCISCO, MONDAY EVENING, DECEMBER 21, 1863 NO. 8.

### ENLARGEMENT AND IMPROVEMENT OF THE MINING AND SCIENTIFIC PRESS.

SATURDAY, JANUARY 2, 1864.

The publishers are pleased to announce the enlargement of this journal on the 2d of January next, from eight to sixteen pages—double its present size.

#### NOTICE.

The publication of the MINING AND SCIENTIFIC PRESS will hereafter be conducted by the firm of DEWEY & CO.

C. W. M. SMITH,

W. B. EWER,

A. T. DEWEY.

San Francisco, Dec. 1st., 1863.

#### TERMS OF SUBSCRIPTIONS.

Upon enlarging our sheet, we have determined to adhere strictly to the advance payment for subscriptions, and shall make only a slight advance in old prices. Our rates, hereafter, will be as follows:—For one year, \$5.00; six months, \$3.00. By city carriers, 50 cents per month.

#### To Advertisers.

The circulation of the Press throughout all the Mining Districts of this State and Nevada Territory, renders it a desirable advertising medium for Mining Companies, Inventors, Patentees, Machinists, Manufacturers, Builders and Tradesmen. Terms reasonable and uniform.

Advertisements for the first issue of our enlarged series, should be handed in at an early day.

#### Sacramento Agency.

W. B. Rice, at the book-store, 146 J street, between 5th and 6th, is our agent for Sacramento city.

#### Our Address.

Parties addressing this office should be particular to write the name MINING AND SCIENTIFIC PRESS in full, to avoid all liabilities of mis-takes.

**BUFFALO.**—A fine buffalo is on free exhibition in an enclosed lot on Third street, near Perry. The animal has been sent from a small calf at Miller's ranch, San Joaquin valley, and is very tame, allowing itself to be handled by those who have it in charge. It has been brought to this city to be slaughtered. It is said that there are but three other buffaloes in this State, which are in Los Angeles county. Large groups of men, women and children may be seen at almost all hours of the day peering through the fence bars, to get a sight at the animal.

**AFTER THE GOLD SPECULATORS.**—Senator Lane of Kansas has introduced into the U. S. Senate a bill providing for the traffic in gold and silver and foreign exchange, for speculative purposes, or the purchase through a broker for less than the full amount of purchase, or in what is known as "margin," is prohibited. It also prohibits sales of gold actually delivered and paid for on delivery, under penalty of not less than \$1,000 nor more than \$2,000 and imprisonment from one to twelve months. The bill should become a law.

**SOME** learned chemists have been trying to find out the color of the salmon, which is not half so important as to know how to catch them. Dr. Davy Macdon says: "Their color is partially due to the nature of their food, and a special secreting power." A safe opinion.

**MR. N. P. WILLIS.** wife of the poet Willis, is teaching school at Idlewild, on the Hudson.

#### TAXING THE MINES.

The Secretary of the Interior, in his report, a synopsis of which has been received by telegraph, still persists in his favorite theory of taxing the mines. The Secretary states that at the time of the discovery of the great mineral wealth of portions of the public domain, the nation was in the enjoyment of domestic tranquility and unrivaled prosperity, and could well afford to throw open her rich mines of precious metals to the unrestricted enterprise of the world; but having now been forced into war for the preservation of our national existence, as unexampled in expense as in magnitude, the question as to whether we can, in justice to other branches of industry and enterprise, longer exempt this immense source of individual revenue from its equitable share of public burden, becomes of much importance. A small proportion of the profits on gold mines would largely increase the means of the treasury, and as no good reason seems to exist why the nation should not, in its hour of need, derive some direct assistance from its extensive fields of gold and silver mines, he earnestly presses the consideration of the subject with a view to that end.

By the provisions of the income tax the mines of the Pacific Coast are already taxed in proportion to all other industrial pursuits, and we do not know that any serious objection has ever been urged against such a policy. There is no disposition on the part of the miners of California to seek exemption from their just proportion of the burdens which the present unhappy war proposes. No especial tax could well be imposed upon the mines except in the way of licenses, and such an imposition would most assuredly result in producing a falling off in the yield of the precious metals, which would work a far greater damage to the general interests of the government than could possibly be remedied by the direct income it would receive from such a source.

The benefit which the General Government is even now reaping from the mines of the Pacific Slope is by no means confined to the three and five per cent. income tax already imposed. The credit of the Government could never have been maintained at anything like its past and present status had it not been for the millions of treasure which are going forward every month from her mines on this Coast. Without this constant supply of gold, government paper would not today have been worth more than one half its present price. It can scarcely be considered extravagant to assert that the mines of California are actually benefiting the government pecuniarily each month, quite as much as an income equal to the entire yield of the mines for that period would do, if drawn from the ordinary sources of government support.

It is only by keeping these mines open and free to all that this yield can be kept up to its present standard. Imposition of such a tax upon the mines, as is indicated by the Report of the Secretary of the Interior, and the falling off in our monthly yield of the precious metals will affect government securities to an extent many times greater than the entire tax which can possibly be collected. Let the government beware least, by tampering, it kills the goose which lays the golden egg.

**ANOTHER RICH DISCOVERY.**—PERHAPS.—"Cosmos," writing to the *Bulletin*, from Virginia City, under date of Dec. 12th, says that "rumors are afloat respecting a new strike—another Comstock. The ore is of the same character, and assays \$6,000 per ton. I will say no more on the subject till I find out more about it; and besides, you San Franciscans appear to have about concluded that you don't care much about having anything more to do with "feet," anyhow. Several new developments are being brought out in the range below Gold Hill. The one in the Uncle Sam and Mary Ann gives great encouragement to those holding interests in the line, though distant."

**MINERAL WEALTH OF UTAH.**—The Governor of Utah, in his Message just communicated to the Legislature, speaks glowingly of the mineral wealth of that region, and recommends the immediate adoption of the general laws of California on the subject of mines, the incorporation act of that State having stood the test of time and experience. It pays a just tribute to the efficiency, energy and valor of the California Volunteers, and recommends the erection of foundries for the manufacture of iron, from native ore, for the Pacific Railroad. The finances of the Territory are in a good condition. There is now in the Treasury a balance of \$26,799.

**NEW INVENTION IN PICTURE COLORING.**—Herman M. Bien, of this city, according to the *Alta*, has applied for a patent on a newly discovered process of coloring common photographs with oil colors, in exact imitation of nature, which he denominates Photolengraphy. The pictures treated by this process have a sharpness and clearness of outline not attainable by the water color process, and, it is claimed, will retain the color unfaded for any given length of time. For copying specimens in botany, etc., this process would seem to be of great value. The inventor claims that he can color one hundred likenesses by this process in a single day, and have each one a perfect picture.

**OPPOSITION STEAMER DAY.**—The Pacific M. S. Co's Steamship St. Louis, and the Opposition steamer Moses Taylor, leave for Panama on Wednesday, December 23d.

**A REESE RIVER MILL.**—The *Reveille* has the following, in regard to a week's crushing at the Fountain mill, in Jacobsville: Some Yankee Blade ore yielded \$425 to the ton, the bullion from which can be seen at Hayne's saloon in Austin. Amador ore yielded still more, but we did not obtain the exact figures. The Emma Funstan, the rich rock being taken from which we alluded to in a recent issue, worked up to the enormous sum of \$2,700 per ton. During the week this mill has worked ore from the Nonesuch, Marengo, Samantoa, Duukirk and Silver Eagle, but complete returns have not yet been made. It may be stated, however, with a certainty, that the yield of none will fall below \$200 per ton, and in some will be nearer \$2,000.

Pigs of lead, with the name of the Emperor Hadrian upon them, are said to have been found in the Island of Sardinia, where the Romans, as is well known, had important metallurgical establishments. The Marseilles house, Bouquet, which owns extensive mines in the island, has made a present of these pigs to the museum at Cagliari.

[From our Traveling Correspondent.]

## JENNY LIND.

MR. EDITOR:—In my last report I stated I had at last got through both the valleys, and had only to take from this place back to Copperopolis. The mines I shall speak about after finishing those in Jenny Lind, lie west of Copperopolis, a portion of them belonging to the Gopher system, and the balance distinct by themselves running down the valley to White's Ranch, where the Stockton road intersects it, better known to the public as the "Four Springs."

Jenny Lind is a small Mining town on the banks of the Calaveras River, where a short time ago there were some very rich placer diggings. It is somewhere about thirty miles from Stockton. Considerable money circulates at times there, I am told; and it is destined, I believe, to see a brighter day than ever, when its copper interests are more matured and developed; for it cannot be denied that so far as external indications go, the leads show themselves here boldly and strongly; while the result of the work upon them which so far has been done, are by no means unfavorable. In locating the leads at Campo Seco, I laid down a course for the Gopher system, which would bring it through Jenny Lind, and I find strong evidences in every direction of the correctness of that location. These I shall briefly mention as I come to them.

A gentleman by the name of Maccebee was kind enough to accompany me the first day. Crossing the river at the town, and after proceeding some miles to Rich Gulch we found the

## DEHLONOCA.

It contains 2,250 feet divided into seven shares. The croppings and opening here are very good. The rock carries mundic largely, and looks well generally. Work to recommence immediately. Next to this, quite near is the

## WATER PRIVILEGE.

It contains 3,600 feet, divided into 3,600 shares. Here they are running a tunnel from Rich Gulch, and from the excellent appearance of the rock cannot, I judge, have much farther to go. There is also an immense body of mundic here. This claim looks well. Not far from here is the

## EL DORADO.

It contains 5,400 feet, divided into 5,400 shares. Main shaft forty-six feet deep; at present full of water. I do not like the location of this shaft, not being suitable for future work. The rock looks well, and shows a strong vein. From this claim something over a mile south is the

## MAMMOTH.

It contains 4,500 feet, divided into 4,500 shares. Main shaft sixty feet deep. This claim is looked upon as the claim of the place, and certainly the croppings and opening are splendid. The rock also is very pure, strongly impregnated with yellow sulphurets. They have, however, sunk down too far west, the lead having already dipped out of the shaft. They are still sinking with an intention to drift east. I cannot see that policy. The labor they have done since the vein dipped, and the labor they must do before striking it again, would have put a new shaft down on the lead all the way. This will however be a good claim. About one-half a mile east from here is the

## WALLOP.

It contains 4,500 feet, divided into 4,500 shares. Main shaft 98 feet. Work being suspended I could not go down, for water. The croppings and opening are excellent; rock pure, carrying much mundic. Altogether it looks well. Next, still going east of south a mile or more is the

## TEUTONIA.

It contains 7,500 feet, divided into 7,500 shares. Main shaft seventy feet deep, showing a well developed vein and foot wall. Everything here indicates future success. I have formed a very good opinion of this mine. It closely resembles the Collier of Gopher. Out-buildings good. We turn right about here for a short distance, and then come to the

## LAFFERTY.

It contains 3,600 feet, divided into 3,600 shares. Main shaft sixty feet deep; croppings and opening good. Rock pure. Work suspended, to be recommenced the following week. Still continuing back towards the Bushville or Rich Gulch for some distance, we reached the

## ACACIA.

It contains 2,700 feet, divided into 2,700 shares. Main shaft 46 feet deep, carrying a strong vein from one and one-half to three feet thick. It is by no means pure yet, but only

wants depth. Close to this, also under the direction of Mr. Gage, is the

## WYANDANK.

It contains 3,200 feet, divided into 3,200 shares. Main shaft 88 feet; with walls eight feet apart. It opens well with gossan, and shows streaks of mundic, lower down, one foot thick; strongly impregnated with yellow sulphurets. This claim looks well to be a winner.

On the following morning Mr. Brush, an old settler, in whose honor the village was named, piloted me round; and like myself, soon found this copper-mine-visiting among the hills is not quite so pleasant as making New Years calls. On a sultry day it starts the dewdrops. After a long walk, however, we succeeded in reaching the

## PLYMOUTH ROCK.

This claim contains 1,200 feet, divided into four shares. It is a second edition of the Hughes Hill claim, Gopher District, only they have put up a large building with an arrastra to crush the surface rock, clay, talc, gossan, etc. It averages twenty-five dollars to the ton in gold. With their facilities of crushing and getting the rock this ought to pay well. The mill is worked by water-power. In connection with this claim, on the north side of the hill is the

## DIGHTON ROCK.

It contains 4,800 feet, divided into sixteen shares. As I have said already this was in connection with the above, only the company here are working for copper. On the north side of the hill they have run a tunnel 160 feet north; probably 60 feet more to go before they cut the vein. Their level will be 180 feet below the surface. Everything indicates the vein to be as strong here as at the Hughes' claim, and I am greatly mistaken if in the end it is not a splendid mine. Near the south side of the hill, a few hundred yards off, is the

## WIDE WEST.

It contains 6,000 feet, divided into twenty shares. Main shaft 45 feet deep. Here the foot-wall is well developed, with indications of a thick strong vein, probably four feet thick. I consider this a promising claim. Reaching the river, and going out of town, north-east some two miles I found the

## JENNY LIND.

It contains 5,500 feet, divided into 5,600 shares. Main shaft seventy feet deep. Like all the claims in this vicinity the croppings are very handsome. There is unquestionably a strong vein; but whether they will strike it in the present shaft is problematical. This sinking on low ground, expecting thereby to strike copper quicker than elsewhere, is a fallacy which has injured the pockets of several companies in this section. Keep off of low spots and allow for slides, is a good maxim. The rock in the shaft is so rent and twisted, no man can tell which way it really dips. On the opposite side of the river, I think the water has opened the vein to vein. Were I interested here I should examine that closely and be guided by it. My opinion is unfavorable to success in the present shaft.

## A DARING FEAT.

This completes the Jenny Lind list. Upon the whole, the mines look well. They are not developed as much as others because they have had no help from capitalists, but the day is not far distant when it will find its way there. I cannot close this account without mentioning an act of heroism, or rashness, performed here by a lady, which beats Blondin. Across the river a little above the town, the water company have a suspension flume considerably over 200 feet high. Before the pipes were put down, some ladies and gentlemen were examining the works, when a banter was given to walk across. The platform at the most could not be more than one foot and one-half wide, yet nothing daunted, the lady started off, walking across and back again, without a quiver or a halt. What made the feat still more fearful was the fact of the platform having canted in the centre, so that on coming there, she was obliged to walk side-ways. The lady is now married and keeps the Jenny Lind House. If she can't "keep a hotel," where's the woman who can?

Leaving Jenny Lind, I take you to Black's Ranch. This is a continuation of Gopher, being only a mile from the New York claim. The only developed claim here is the

## MURPHY.

It contains 2100 feet in single shares. Main shaft 64 ft., showing a strong vein, nearly twenty feet wide. Rock somewhat corrupt. The walls are very singular; I think they will have to go deep, but they have strong evidences of cop-

per. Near here are quite a number of undeveloped, but promising claims, worthy the attention of capitalists. I cannot do more than name them at present. They are the Munroe, Jefferson, Emerald Isle, National Ledger, Virginia, Pine Grove, Rabbit Hill, Elephant, Josephine, and a gold quartz ledge, Buena Vista. This little, out-of-the-way, obscure corner will make a noise some day. My obligations are due to Mr. Black, who is very intelligent, gentlemanly and well posted in copper feet. From here to Mr. S. Cohen's store is about three miles, where I found the

## SALT SPRING VALLEY CO.

It contains 3150 feet, divided into twenty shares. Main shaft 70 feet, carrying a good vein all the way down. The claim is very important, and excites much attention just now; for, although started for copper, it is supposed to be silver. Of the latter rock, I do not profess to be a very competent judge; but, if in so essentially a copper formation as this district is, it is possible for a silver lode to exist, this must be one. At present, it certainly is not copper. Mr. Cohen intends to send a large lot of this rock to Mr. Clouser, of your city. I hope he will give the Press the result. About a mile from this is the

## HARLEM.

It contains 4500 feet in 30 shares. This claim once reached as high as \$5,000 a share, and it is now lower than it ought to be. All the former work in the old shafts down as deep as 100 feet, was in serpentine rock, and you may as well expect to find gold bearing quartz with horn blende as to find copper in serpentine. I know, very well, copper I found up to the base of this associate; but never in quantity. My opinion is, the copper miner had better buck against a monte bank than serpentine rock, from the one he may get perchance a stray dollar; from the other, nothing. A careful examination of the Harlem confirms this opinion. I was glad to find the Harlem people had commenced a new shaft, altogether away from the serpentine where they have a good prospect. The present shaft open well, and looks promising and hopeful. I have to acknowledge Mr. Westby's particular attention to me. Continuing from the Harlem down the valley, a mile below White's ranch, is the

## WAN.

It contains 3750 feet in 25 shares. Main shaft 54 feet with a very handsome rock indeed. It is on the Harlem lead, and lies west of Copperopolis about two miles. I ought to have been included in my second letter, but at the time I did not know of its existence. The vein looks well carrying yellow sulphurets. It is by all odds too important to be overlooked. Below this claim is another, called the

## MAMMOTH.

It contains 6000 feet in single foot shares. Main shaft commenced, only twelve feet deep. Croppings good. Rock taken out shows strongly of mineral, and some yellow sulphurets. Mr. Ring is superintendent; work suspended in next spring.

I have still three claims to mention, two of which ought to have been noticed in my first letter, but I did not know of them then; the other at that time had not been located. The first is the

## INIMITABLE.

It contains 3000 feet in single foot shares; with two shafts, respectively 30 and 40 feet deep. This is one of the early locations, but only recently attended to, or thought much of. It runs parallel with the Union, on the east and in the first shaft they got good rock; in the second, better. Joining this claim, running out of town south, is the

## METROPOLITAN.

It contains 3000 feet in single foot shares. Main shaft 100 feet deep, showing excellent rock with yellow sulphurets just appearing. The importance of these two claims consists to a great extent, in the fact that they will solve the problem of the linear course of the Union lode, through and immediately south of the town. If the Keystone people get good copper out of their side claim (east) which would be a continuation of these claims running north, as out of old discovery shaft, and it is known they do, these claims become necessarily of great value. As I look at it, the Keystone thus becomes the great claim of the district, and the two eventually of corresponding importance. So impressed is your correspondent with this opinion, that in connection with Mr. Stoddard, he has located 2200 feet in continuation of the Metropolitan, on the south end. With the indication of that claim, so far as the work has gone, we have every reason to be satisfied. Adjoining this latter claim is the

## INDEX.

It contains 2200 feet in 15 shares; in course of incorporation and being opened.

I have now finished the copper claims of Calaveras county as far as practicable. Some few, I know, have been omitted which I was unable to visit on account of the weather, circumstances I could not control. I can truly say I have not intentionally omitted a single one, laborious as the work has been. Whatever I have said of each claim, I have said in a spirit of justice, unbiased throughout by any motive. Some little mistakes there may be, but upon the whole I believe, I may claim to have given a copious and correct count of the present condition, and future prospects of the mine. L. H.

THE AQUILA AND HER CARGO.

The San Francisco Chamber of Commerce held a special meeting on Friday last, to consider what steps, if any, could be taken by that body to further the object of saving the Commanche, so needful for the defence of this harbor. During the deliberations it was made to appear, to the apparent satisfaction of the Chamber, that if the materials of the Commanche, could be landed from the wreck properly and promptly although some parts of her furniture, etc., would be destroyed and other parts much tarnished, still the ship might be speedily re-constructed, and placed in a proper condition for the service, for which she was originally designed. Mr. Ryan, one of the contractors, who was present stated to the Chamber, that the contractors were ready to go on and complete their contract as soon as the material was placed upon the wharf. Mr. R. further stated that insurance to the amount of \$400,000 had been effected upon the Aquila and her cargo which had been transferred to the Government on account of advances made on the contract.

From this statement it appears that the Government has not, in this instance, departed from its well known custom, of never insuring against losses. It merely holds the policy issued to another party as security for advances made. It further appears that the difference of opinion, among the underwriters, with regard to their liabilities in the matter had not been settled, so far as known, up to the hour of the above meeting.

The Chamber having decided that it was proper and expedient that they should take some action in the matter, the following resolution was adopted as a preliminary step:—

*Resolved*, That a Committee of Five be appointed to confer with the Underwriters' Agents in this city, and with other persons, if necessary, and to procure a written statement of all the facts that have been developed concerning the situation and condition of the ship Aquila and cargo, as they now lay, and also to procure a written statement, as authoritative as possible, of the respective claims and liabilities of the parties interested in said ship and cargo, both of which written statements to be submitted to an adjourned meeting of this Chamber, to be held on Monday, the 21st inst. at 2 o'clock, P. M.

It is to be hoped that some definite action will soon be agreed upon, by which the Commanche may be landed and put up as speedily as practicable. We presume that no well informed person entertains a doubt, that had this wreck been private property, in the hands of energetic men of means, and not complicated by an uncertainty of ownership, the materials of the Commanche would, ere this, have been in an advance progress of landing. To think otherwise would be an unjust imputation on the skill of San Francisco Mechanics.

THE EARTHQUAKE, on Saturday afternoon was the severest which has been experienced in this city for the past eight years. Two shocks were felt—the second of which was much the most severe. They were accompanied with the usual rumbling noise, which at our point of observation, in the rear of the third story of the Government House, was quite as distinct and loud as would have been that caused by a heavy lumber wagon driven rapidly and violently over the cobble pavement in the street.

It is said that California produces but little corn. the soil not being adapted to its culture. Most of what is raised is consumed while green, at the table.

THE BRYAN BATTERY.

The vast interest involved in the reduction of area on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect unit—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1880, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley, San Marcial Co., Mexico, John D. Winters & Co., Esmeralda, Crown Point Co., Gold Hill, Potosi Mining Co., Virginia City, Tajo Mining Co., Mexico, Sheba Mining Co., Humboldt. Lotta Mills Co., Coso. WM. H. MEAD, THEODORE VAN TASSEL.  
MEAD & VAN TASSEL,  
HATTERS,  
Montgomery st., cor. of Commercial,  
SAN FRANCISCO.

TO OUR FRIENDS AND THE PUBLIC GENERALLY.  
Having Purchased the entire interest of Messrs FISHER & Co., in this city, we shall, on the 1st day of May assume the management of the

HAT EMPORIUM,  
so long conducted by that firm.

Mr. WILLIAM H. MEAD, for the last seven years Salesman with Messrs Fisher & Co., respectfully solicits a continuance of the patronage so long and liberally bestowed upon the old House, feeling entire confidence in our ability to suit in every particular.

Mr. THEODORE VAN TASSELL, for eight years with Messrs Le Gay & Co., would be pleased to see his friends at his new place of business.

The long practical experience of Messrs Mead & Van Tassel in the Trade justifies them in saying that their work cannot be excelled either in finish or durability. Having perfected arrangements, we shall be in constant receipt, by every steamer of soft goods of the very finest French and American Manufacture.

Our Stock now on hand is superb.  
Call and examine, and judge of the merits of our claim to the title of "LEADERS OF FASHION!"  
Respectfully,

MEAD & VAN TASSELL.

PRACTICAL ACCOUNTANT,  
305 Montgomery Street, Corner of Pine.

TO QUARTZ MINERS.

All persons interested in Mining Machinery are invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured.

WANTED

By a competent person, the Secretaryship of four Mining Companies. Books to be kept at the Office of the Mining and Scientific Press, No 67 Government House Inquire as above. oct6

## SILVER MOUNTAIN DISTRICT.

Silver mountain District is situated on the last range of the Sierra Nevadas, near the eastern boundary of Amador county, being about forty-five miles from the Big Trees and sixty-five from Virginia City, N. T. The Big Tree and Carson Valley Road Company are building their road to Silver Mountain District, which will be finished by the first of May next, having only two miles to complete at the Silver Mountain end of the route. This road leads from Stockton, through Murphy's Camp and Big Tree Grove to Silver Mountain, connecting them with the Carson Valley Co's Road which is nearly completed from Markleyville. This will give uninterrupted communication from Stockton to Virginia City by stage, tapping the Monitor, Alpine, Mogul Silver King and Webster Districts on the way. Freight can be brought over this route from Stockton at from  $2\frac{3}{4}$  to 3 cents per lb for eight months in the year.

## SILVER MOUNTAIN

Is the principal town in these Districts, and is situated in a valley lying between two ranges of the Sierra Nevada with a beautiful river running through it, furnishing a supply of water, sufficient to run the largest mills. It would indeed appear, as if Nature had set apart this spot for all the conveniences and facilities of a large mining town. The population during the past summer was from six to eight hundred persons, but at the present time it is considerably reduced in consequence of the road not being finished before winter set in. The town is about one mile in length by half a mile in breadth. The principal business streets are Main and Union which are parallel with the river. There are more in contemplation so soon as a sufficient quantity of lumber can be prepared for building purposes. There are two saw mills in operation which will furnish a sufficient supply in the spring to meet all reasonable demands; at present they are producing lumber at the rate of from 12 to 14,000 per diem. The current price of lumber will be from 30 to \$40 per 1,000 feet, according to quality. There is now being made an excellent quality of brick at from 12 to \$14 per M., and several brick buildings are under contract, and will be completed in the spring. An excellent quality of free-stone is found in abundance in the immediate vicinity of the town, which is well adapted for building. There are two good hotels, and two more are to be erected during the coming spring. The price of board is from 6 to \$10 per week, and good lodgings at from 50 to 75 cts. per night. There are six large stores with extensive stocks of assorted goods, suitable for a mining region; one French restaurant one tin shop and hardware store, one brewery, two laundries, three blacksmiths' shops, three livery stables, and innumerable pioneers of civilization, called whiskey mills, making in all quite a respectable mining town.

## THE MINES.

With regard to the ledges, they are for the most part, large and well defined, and run in a northerly and southerly direction with extensive croppings and fine indications of mineral wealth; they are found in all directions from the town to a distance of four miles and further. On the West side of the town are many claims which were the earliest taken up in the District. The first that may be noticed, is the Mountain claim which crops out largely, very high up on the mountain; the croppings being about 25 feet wide. The owners have run a tunnel over 300 feet and struck a ledge which shows good pay rock; assays have been made as high as \$184 to the ton. A company of capitalists are now in negotiation with the owners, to buy the controlling interest, and if they consummate the purchase, it is their intention to put up a mill and work the claim vigorously the coming season. The Silver Creek Co. which adjoins the Mountain Co. North, have run a tunnel 100 feet, and expect to strike their ledge at about 50 feet more. The St. Charles Silver Prize Co., Mammoth, Geo. Washington, Frank, Big Tree, Chrysal, Baltimore and Uncle Sam are on this range, and have tunnels averaging from 50 to 100 feet. North of the above ledges, and on the eastern side of Silver Creek, is the Mary Frances Co. This Company has a tunnel some 50 feet and will strike their ledge in 50 feet more, with every prospect of obtaining good pay rock.

At the eastern side of the town, is the Scandinavian Canon in which there are some rich claims, the first of which, after leaving the flat is the Alta Co., owned principally by San Francisco capitalists. They have run a tunnel 75 feet

and are close upon the ledge. Immediately adjoining is the Scandinavian Co. with 160 feet of tunnel. Above these are the Gould & Curry, J. C. Fremont, Pine Tree, Buckeye, Extensionado, I. X. L. and Lady Franklin, with many others which have been partially prospected.

As the I. X. L. Co. have struck their ledge and had a ton of the rock worked by different processes in San Francisco, it deserves a brief eulogy. The I. X. L. claim was taken up in the spring of 1862, by J. H. Williams and others, the claim extending 1000 feet. They had tunnelled in about 50 feet, when they struck the ledge  $4\frac{1}{2}$  feet in width. The yield from one ton of the rock, worked by different processes averaged \$200. One piece weighing 20 lbs, worked by the "Varney" process, gave \$627 in gold and silver to the ton. This Company intend to erect a mill in the spring to work their ores. Very little stock in this claim is in the market, being nearly all held by capitalists in San Francisco; the principal of a large English Banking House owning a large interest. The I. X. L. No. 2, is the 1st North Extension of 1500 feet in extent and bids fair to be as good as the original, when prospected. The segregated claim of Treat & Dodge, 100 feet, is the 1st South Extension and the Omega Co's claim of 400 feet is the next adjoining South. This is one of the best locations on the ledge and will be thoroughly opened in the spring. They are sinking a shaft alongside the ledge and at a depth of 50 feet will drive through it, with the expectation of finding very rich rock. More Acron

## A MONSTER BLAST.

The Von Schmidt Gas Company, who have been leveling off a location for their works, on the south portion of the square between 2d and 3d streets, and Townsend street and the Bay, concluded recently to put a monster blast into the hill, near Townsend. This was effected by tunneling about eighty feet into the hill, with a cross-cut of about 40 feet at the innermost point, in the shape of the letter T. In this cross-cut a charge of about  $1\frac{1}{2}$  tons of powder was placed, and fired off about 10 o'clock on Thursday last; the result of which is described as follows in the *Alta*:

"The explosion accomplished all that was expected of it in the way of shattering the cliff, so as to facilitate the work of excavation, and it did even more: it not only blew up the bluff, but very nearly served the inhabitants thereabouts in the same manner. The bluff over the tunnel and chamber was completely shattered, and the rents in the rock even extended so far as to open large cracks in the surface of Townsend street. The report following the explosion was hardly louder than that of an ordinary 12-pounder, but the shock was so severe, that a large amount of damage was done to some of the buildings in the vicinity. The dwellings of Messrs. Rising, Robert, Grant, and Captain Avery, situated on the south side of Townsend street, near third, were all more or less damaged by the cracking of the plastering and throwing down of the ceilings; and the residence of Mr. Divine on the east side of Townsend street, some distance back from the street, was shaken so that the cooking stove in the kitchen, jumped some inches from the floor, if we may credit the statement of an eye witness. Mr. John Grant's house was the most injured, the ceilings being damaged to the extent of nearly, or quite, \$1,000. In the house of Capt. Avery, a small statue was thrown out of a niche in the wall and broken to pieces by the force of the shock. Mr. Grant had intended to have an injunction served upon the company, to prevent the explosion coming off, but, they got the start of him for once."

This, we believe is, with one exception, the heaviest blast ever fired in California. The exception to which we refer was one which took place near Smartsville, in Yuba county, about a year ago. In this blast about twice the amount of powder was employed. A tunnel was run into the hill 190 feet, with a cross-cut of 25 feet, in which the powder was placed and the tunnel tightly closed and packed or "tamped" with earth for the space of about 75 feet from the entrance. When the explosion occurred, the hill for about 300 feet square, from the bed rock to the surface—a distance of about 100 feet—though composed of very hard and compact cement, was thoroughly broken up, and thrown into ridges, very much like mammoth plow furrows. The amount of earth thus loosened would require a stream of 400 inches of water, for over three months, for washing.

FAST STEAMBOATING.—The Daniel Drew, a fast steamer on the Hudson, is said to have recently achieved 16 miles in 36 minutes. This statement is almost incredible.

THE present total revenue of Russia is £44,374,248, of which £18,000,000 is obtained from the tax on brandy. £15,225,111 goes to the army, and £2,941,404 to the navy.

## THE CHICAGO, or "NICHOLSON" PAVEMENT.

MR. EDITOR—I notice in your issue of the 13th instant, the following paragraph in relation to the new wooden pavement, recently introduced into Chicago, and now generally known throughout the north-Western States as the "Nicholson Pavement":

CHICAGO WOOD PAVEMENTS.—The Board of Works in the City of Chicago have given the preference to wood pavements over those of stone, as being the most durable of any kind yet used there. The following is a description of the method of construction: Lay down flooring of one inch board on a bed of sand; coat the floor with asphaltum; stand on end blocks of wood six inches high, by three inches thick, and nine inches in length, in rows about one inch apart, divided by strips of boards. Fill in these open narrow spaces with asphaltum. There are six miles of these pavements in Chicago, which after six years constant wear, are found to be nearly as perfect as when laid down.

As I have for some time been well acquainted with the facts in relation to the introduction and wear of this new pavement, I have thought it might be interesting to many of your readers to learn a few facts in addition to those given in the above paragraph.

Chicago is not only thus, but the city of Milwaukee, Wis., which has ever been noted for its smooth brick pavements, and other cities have commenced laying the Nicholson Pavement. The expense of this paving is less than that of stone—is laid with great rapidity, and for durability, as well as level smoothness, has never been equalled. Carriages move over it with all ease, and without the least jar; the blocks are seldom if ever, torn up, being tightly wedged in with coal and pebbles, upon which hot tar is poured, and then covered with coarse sand or pebbles. The Nicholson pavement is superior to any other, and gains the awarded tribute of excellence of all who know of its superior merits and durability. Western cities have grown disgusted with brick and stone and all the old pavements are being torn up to make way for the new "street floor," the Nicholson pavement. The city of Milwaukee laid, during the last year, three miles of this pavement, and Chicago as much more, and both cities will ere long have no other. Cincinnati and Detroit have contemplated and are making arrangements for the same kind of pavement, through the principle business streets.

LISLE LESTER.

TREASURE SHIPMENT.—From the 1st of December to the present time the amount of treasure shipped from San Francisco to the various ports aggregates \$2,812,858 96. The total amount shipped since Jan. 1, is \$44,111,999 13. The total amount for the corresponding period of last year was \$40,830,182 41, showing an excess in the shipments of this year of \$3,281,816 72 over those of last year.

## MINING SHARE MARKET.

There has been a fair amount of business in the mining share market, during the past week, and prices have generally had a favorable tendency. Encouraging reports from the mines have given new life and activity prevades the market.

Ophir shares have been in considerable demand at fluctuating prices. At the annual meeting held on the 16th inst., the following gentlemen were chosen Directors for the ensuing year: E. Martin, Chas. F. Lott, Joseph Woodworth, A. E. Davis, J. B. Haegin, L. W. Coe and Jesse Holiday. Mr. E. Martin was chosen President, and Mr. Lamb continued Secretary. Mr. W. Palmer, who has had charge of the mine, as Superintendent for the past year, is continued in that position. Many had supposed that the meeting would have been somewhat stormy, but the reports of the President and Superintendent were so satisfactory, that it passed off very harmoniously. The latest accounts from the mine, particularly from the north end, are highly satisfactory. Dividends for the present month have been sold during the past week at from \$37 to \$42 per foot.

Gould & Curry have advanced to \$4,800 cash, and \$4,900 at thirty days. Dividends for December sold early in the week for \$135, but closed freely at \$140 offered, with sellers at \$145. This mine appears to be "giving out" at an alarming rate. It is reported that the amount of bullion taken out at their mill, during the twenty days previous to Dec. 11th, was 9,381 lbs. of amalgam, worth \$225,000. Comment is uncalled for.

Savage shares have declined a trifle, and is quoted at \$2,700, with sellers at \$2,750. But one transaction is noted.

10 Utah, \$39 per share,	ber, \$42½ per foot.
10 Utah, \$37 ¾ share.	10 Baltic, 85 per share b30.
10 Lady B van, 10 per share.	10 Baker, (copper,) \$47
10 Lady Byron, 11 per share.	10 Wilson, (copper,) \$42
4 Melones, 75 per share, b15.	20 Omega, tr. H., \$19.
4 Melones, 80 per share, b30.	50 Ruston Suu, \$10½ b 30
4 Melones, 80 per share—b 15.	80 Bullion, G H, 56 per share, b 8

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented in securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

### A New and Valuable Book.

**Process of Silver and Gold Extraction,** by Guido Kustel, Mining Engineer and Metallurgist, former manager of the Ophir Works, &c; 350 pages octavo illustrated.

This admirable work has met with the highest commendations from the Press and Scientific men, as a clear and able exposition of the science as practised in California and Nevada Territory—it is written for the people in good plain English and finely illustrated.

Price—post paid—Cloth \$6; Sheep \$7

### IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventor. EWER & SMITH.

### WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. nol6-tf

PUMPS!

HARRISON'S

California Lift and Force Pump,

WITHOUT VALVES OR PACKING.

Suitable for Mines, Fire Engines, Wrecking or Irrigating. This is the cheapest, lightest and most durable, and least liable to get out of order, of any Pump yet invented.

ALL SIZES;

Capable of throwing from ONE HUNDRED TO FIVE THOUSAND Gallons per Minute—For sale by

C. H. HARRISON,

PHOENIX OIL WORKS,

10-16 517 Front Street, San Francisco.

50 lbs. MARINE and  
Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

35 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

DIRECTIONS:

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

G. T. FOURQRE, Superintendent.

WORKS, North Beach; Office, 500 Sacramento st., San Francisco.

HEPBURN & PETERSON'S  
AMALGAMATOR.

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the minerals from

GOLD AND SILVER ORES,

manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First Street, San Francisco.

These machines secure to the miner a more expeditious and perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machines now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Yehyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

in California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 65 per cent of the Fuel.

Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to set and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street, San Francisco.

Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to a pound, on the square inch. It cannot get out of order and any person can put one up in an hour after the damper is put in.

Ingersoll's Patent Drill Press,

With which drilling can be done the same as with the common ratchet, and when small holes are wanted, it can be done four times as fast. The handle can be worked in any direction.

Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

E. T. STEEN AGENT.

No. 33 Fremont Street, San Francisco.

cluding all that relates to mines and mineral products of economical value; the fourth, the botany and zoology, and the fifth would contain such maps, sections and other illustrations as were not introduced into the other volumes, or printed with the text. It is possible, however, that some of these volumes might have to be divided into two parts, owing to the large quantity of matter it might be desirable to publish. \* \* \* The appropriation for the survey made for the second year of its continuance by the Legislature of 1862 having just been paid, a volume is now due the State. The work has already been begun and will be carried on as rapidly as possible, provided the Board of Examiners will audit my estimates for the printing, to the extent authorized by the law, so that I can make the necessary financial arrangements and be enabled to pay for the work as it progresses by borrowing on the security of the State warrant. \* \* \* The printing of another volume of the report can be commenced whenever an appropriation is made for the same by the Legislature and the money provided for the purpose.

IMPORTANT TO MINERS.—The Supreme Court of California has just settled an important point concerning the right of locators of mining claims, and as the same state of circumstances is very likely to again arise, we publish the decision as we find it in the San Francisco Journal:—

Coleman et al. vs. Clements et al. is the title of a case wherein our Supreme Court settles some points which it is important to know. In February, 1861, three persons, in the name of themselves and twenty-seven others, some of whom knew nothing of the use made of their names, or of the intention to do so, took up and marked out a copper claim of 4,500 feet. Afterwards, in June, 1861, twenty-three of the original locators, with seven others, formed a new company and relocated the same ground, claiming that the original location had been abandoned by the failure of the seven left out of the new organization, to perform, as the mining law required "one day's work on each claim every thirty days from the 1st of May until the 1st of December in each year." Five of the seven thus left out in the cold, brought suit to recover five-thirtieths of the claim, and the cause having been appealed to the Supreme Court, that tribunal decides as follows:

That the claim is a joint one—that is, 4,500 feet, located in the joint names of thirty persons, and there is no location of any distinct portion thereof in the name of any one of them; that it was therefore impossible for each locator to do a day's work on his own claim, and the law quoted, must not, in the absence of express terms, be construed as requiring him to do so; that in cases of forfeiture, terms are to be construed strictly, and here the word "claim," which properly includes all kinds of claims, joint as well as separate, means a claim held by individuals jointly, just as it does a claim owned or held by one person. And one day's work, that is, the labor of one man bestowed on a mere individual claim. On the point of adverse possession set up by defendants, the Court says that to make such possession available against a co-tenant, there must be an intent on the part of the tenant in possession to hold adversely, and such intent must be indicated by acts calculated to exclude complainants from all participation as tenants in common. The possession of one tenant in common is presumed to be the possession of all, and this possession is not overturned by the mere fact that the one in possession does not recognize his co-tenant. The judgement given in the Court below, in favor of complainants, is therefore affirmed."

The last idea of Paris, says one of the correspondents of the daily journals, is a plan in alto-relievo of the whole of Europe, not in maps or models, but actually raised out of the ground. A garden is to be set aside for the modeller, who, taking Mont Blank, fifteen feet high, as his point de depart, is to raise in just proportion around in the rest of Europe, pour the seas into their proper places, and intersect the whole with roads, canals, railways, and telegraphs. A steam engine is to act the part of the moon, and regulate the tides.

GEOLOGICAL SURVEY.

According to the Report of the State Geologist, he is steadily and industriously prosecuting his important and interesting labors. In it he indicates what is necessary to be done in order to continue the survey, and to perfect what has already been done. The contributions to science, and the immediate and prospective advantages to our State, which it is believed will follow a publication of the forthcoming volumes, will prove the wisdom of creating the office of State Geologist and of continuing its existence.

There are only three counties in the State in which some work has not been done by the survey, and those are Klamath, Humboldt and Mendocino counties, in which Indian difficulties have hitherto rendered it almost impossible for the small party to operate to any advantage, or without considerable risk.

Mr. Whitney says: "It seems proper, at the present stage of the survey, to make some statement in regard to the probable amount of time and money required to complete the work. Indeed, in my address before the last Legislature, I promised to do so during the coming winter. It is especially necessary that some action should be taken soon in reference to this matter, as the amount and character of the printing to be done this winter will depend on the settlement of the question whether the survey is to be continued; if so, for what probable length of time.

Undoubtedly, were the State in a position in which economy in the public expenditures was not of the highest importance, there would be no question that the survey might be continued to an indefinite period with advantage, since all will admit that the results proposed to be gained by a work of this kind, if it be properly conducted, could not fail to be beneficial to the community. Thus, no one in California objects to the minute accuracy and consequent expense of the coast survey work upon our shores, since the burden of payment does not fall directly on our shoulders. \* \* \* The farthest limit of completeness to which I ever aspired to carry this survey was the completion of a map of the whole State on a scale of six miles to the inch, making nine sheets, each about three feet square, with the geology worked out on a corresponding scale of accuracy. Further experience in the State, and more knowledge of what the people expect, and a personal experience of the condition of the treasury, have convinced me of the impossibility of carrying out this undertaking, for which certainly not less than fifteen years will be required. I am fully convinced that the work, carried to this extent of completeness, would be of sufficient benefit to the State to justify its being done; but I am also equally well assured, in my own mind, that the people would not recognize the value of the survey until after it was completed, and that, consequently, it would be impossible to carry it forward on a matured plan without danger, and almost certainty, of its being interrupted.

In weighing the matter carefully, I have concluded that four years longer is the extent of time to which the survey should be protracted, with a liberal appropriation—of not less than \$40,000 per year. But I am, furthermore, of opinion that the survey should be suspended altogether, until such time as the finances of the State are placed on a cash basis, as I find that the delay and anxiety caused by the necessity of borrowing to meet the advances required by the treasury' from one two years behind hand in the payment of the appropriations, is too disagreeable and prejudicial to the interests of the State and the progress of the work to allow me to be willing to continue on the system any longer. \* \* \* The result of the survey, in case it should be actively continued for four years longer, would probably be comprised in about five large volumes, of which the first would embrace the physical geography and general geology of the State; the second, the description of the fossils found in our rocks, both those of animal and vegetable origin; the third, the economical geology, in-

## CROCKER'S

## STOCK and ASSESSMENT LEDGER.

Copyright Secured—Price \$10.

The necessity of a proper book for keeping the Stock and Assessment accounts of Corporations has long been very much needed. One that would combine economy and simplicity, and would not require the services of an experienced book-keeper to keep the accounts correctly. CROCKER'S STOCK and ASSESSMENT LEDGER has met this requirement; we have submitted it to several Secretaries of corporations, and they acknowledge that the plan is admirable, and just what has long been wanted. The printed headings are a perfect explanation of the manner of keeping it, and any person, whether they understand book-keeping or not, cannot make an error in the accounts. The Stock and Assessment accounts are so arranged that the Secretary can at a moment tell how any stockholder's account stands, both in regard to Stock and Assessments. He can also, with the greatest ease, trace any certificate, through any number of transfers, to the original one issued. It saves a great amount of labor, as it does not require one fourth the writing of the ordinary method. It dispenses entirely with the old style of Stock Ledger, Stock Journal and Assessment Book, all three of which Secretaries have heretofore been obliged to keep, condensing the whole in one book. To a Secretary who is Secretary of several companies, this book will prove a valuable one, as we feel no hesitation in guaranteeing satisfaction to those who may order them. Send men sheets sent to those who desire to examine it. The books are ruled with one or two accounts to the page. State which is preferred.

Five Copies, one year,.....20.00

The present proprietors of this journal announce with confidence their determination to render to the friends of Science, Mining and Mechanical Industry a newspaper published upon this coast worthy of their patronage at home and their pride abroad. We shall seek favors only through our endeavors to merit them.

**Illustrative Drawings and Engravings**

Superior in finish and useful and attractive in character, will be published from time to time, representing the most important new inventions and improvements in the art and science of

**Mining and Mechanism**

Developed upon this Coast. Each number of the paper will contain full and correct reports of

Sales by the Stock Boards of San Francisco.

Sales by the Stock Board of Virginia City.

Sales by the Stock Board of Esmeralda.

Sales by all Mining Stock Boards.

Reports of Bids and Sales in San Francisco.

Reports of Bids and Sales in the Territory.

A Weekly Review of the Stock Markets.

A Weekly Review of General Mining Interests.

General Summary of California Mining News.

General Summary of Mining everywhere.

**Valuable Information for all Miners.**

Indispensable Knowledge for practical workmen.

Practical Suggestions for intelligent artisans.

**Valuable Facts and Statistics**

Essential to members of all trades and professions; the best approved methods of mining; the latest discoveries and inventions in mining operations; practical, scientific views upon geological and mineralogical questions; the proper methods of reducing ores and saving the precious metals. In fact every sentence calculated to lessen the number of hard blows uselessly rendered by miners and working men, and add wealth by intelligent saving of material or labor, will find welcome space in our columns. The paper will afford many

**Practical Hints**

With regard to the manner of working and securing mines, derived from the actual experience of parties in our own and other countries. Also hints concerning the location and possession of mining grounds; the laws peculiar to different districts and countries; and notices of all important decisions of the law in mining cases. As a

**Book of Reference**

The bound volumes of the Press will find no rival in value to the intelligent and industrious citizens of the Pacific Coast, who cannot but feel a source of pride in the history of the inventions, discoveries and prosperous developments of the remarkable era through which we are now passing.

**The Stock Record**

As presented in our columns will be found correct, distinct and most convenient for preservation and future reference.

**For Sending Abroad.**

As a paper for mailing regularly to your friends in the East, or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Friends pleased with our success in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

**DEWEY & CO., Publishers.**

**THE MINERS' LABORATORY;**  
A COLLECTION OF  
**IMPORTANT AND VALUABLE INFORMATION**  
FOR THE BENEFIT OF  
**Miners and Prospectors.**

**THE SCIENCE OF MINERALOGY.**

During the past few months we have been publishing a series of articles under the above head, in which we have endeavored to collect such information as shall be of practical value to the miner and prospector, in their labors and explorations in the field. The early numbers, which treated upon copper, having been long out of print, it has been suggested by many of our recent subscribers, that we should reprint them for their benefit, and for the benefit of many of our old subscribers, who desire to have them collected into a single number. In accordance with these suggestions, we give, in the present issue, so much of said papers as are of any special value. We shall still continue our Laboratory articles, and endeavor to render them, more than ever, an interesting and important feature of our journal.

The primary object of the science of mineralogy is the development of mineral bodies; a knowledge of their characters, forms and combinations; also the circumstances and conditions in which they are found, and the substances with which they are combined. This is the practical object of mineralogy and the point upon which we propose to treat principally in these papers.

A development of the nature of minerals, a knowledge of their elements, their properties and uses, constitutes the economical portion of the science, which though highly interesting and useful to mankind, is not a matter which we propose to discuss to any extent. The miner is directly interested only in the development—the bringing to the surface—of the minerals of the earth; their economy and general introduction into the various channels of business, he leaves to those into whose hands he delivers them in their rough state.

We know but comparatively little of the earth beyond the depth which has been reached by mining operations. This depth when compared to the entire bulk of the earth, may be correctly compared to the minute scratching and pin punctures of a coat of varnish on a 12-inch globe. All beneath is mystery and speculation. Of this we shall treat more at length in future numbers.

A Mineral is an unorganized body, differing from an organized or living body in its structure, in the manner of its formation and of its increase or growth. While organized bodies increase by means of their internal organs, which assimilate and retain in the system what is beneficial and reject what is useless, unorganized bodies increase externally.

A simple mineral substance, as pure gold, silver, etc., may be described as an organized body, presenting an aggregate of lesser particles of the same nature, united by affinity.

Every mineral possesses two distinct kinds of character, by one or both of which it may be distinguished from other substances. These are termed the *external* and the *chemical* characters. The former are commonly apparent to the senses, and the latter are those which are developed during the chemical decompositions, which may be accomplished with or without heat. These characters are denominated as follows: Aspect, or kind of lustre; color; hardness; specific gravity; streak; form; structure; cleavage; surface; tenacity and transparency.

Aspect, or kind of lustre, is very important, and is divid-

ed into metallic and non-metallic aspect: they are often blended in the same mineral. Many minerals also possess two distinct kinds of lustre, one externally and the other internally. The true metallic lustre may always be distinguished from the metallic, pearly-adamantine lustre, by its being always combined with perfect opacity, and by remaining unaltered on the scratched surface.

Color is also of considerable importance when combined with metallic aspect. In speaking of color, in connection with minerals, the depth or shade of color should be carefully noted, and the peculiarity of shade expressed as near as possible, by reference to some well known substance.—The metallic colors are white, divided into silver and tin-white; grey, lead-grey and steel-grey, yellow, brass-yellow, bronze-yellow and gold-yellow; black and copper-red.

HARDNESS is one of the most important of mineral characters. There are generally reckoned ten degrees of hardness: 1, yields easily to the nail. 2, yields with difficulty to the nail. 3, scratches a copper coin, but is also scratched by it. 4, not scratched by copper, but is not hard enough to scratch glass. 5, scratches glass, though with difficulty, leaving its powder on it, and yields easily to the knife. 6, scratches glass and yields with difficulty to the knife. 7, does not yield to the knife, but does to the edge of a file, though with difficulty. 8 and 9, harder than flint. 10 cuts glass.

SPECIFIC GRAVITY.—That is, the weight of a body compared to some other body of the same size or volume. This latter body is assumed as a standard; this standard is pure water at a temperature of 60° Fah. A cubic foot of water weighs 997-136 ounces—usually taken as 1,000. A cubic foot of silver weighs 10,000 ounces; therefore we say silver is ten times heavier than water, and its specific gravity is 10-0.

STREAK is a very effective character; it signifies the color of powder, produced by drawing or streaking a mineral across a file. The best way to distinguish the streak is to take a fine file, and draw it once or twice across the mineral, pass it lightly over your finger; when the color will be left thereon, and may be easily noted.

FORM is a character, when regular, of the highest interest, yet of limited utility in the discrimination of minerals.

STRUCTURE AND CLEAVAGE.—The structure of minerals is the mode of aggregation of the particles of which they are composed. *Lamellar structure* is composed of broad, distinct concretions, of about equal length and breadth. *Prismatic, or bladed structure*, consists of long and narrow concretions, forming a transition from the lamellar into the fibrous structure. *Fibrous structure*, consists of fibrous, or very thin and capillary concretions, either straight or curved. *Granular structure* is composed of minute or small concretions, and appears to consist of one compact mass.

SURFACE.—The surface of minerals may be either uneven, granulated, rough, smooth, or streaked; streaked surfaces often arise from a close fibrous structure, or otherwise indicate the direction of cleavage planes.

TENACITY.—The following are the different degrees of tenacity:—*Brittle*, such as grate under the knife, or fly off in the form of powder when attempted to be cut; and break into powder when placed on an anvil and struck by the hammer. *Malleable or ductile*, the property possessed by minerals which may be cut by the knife, and which flatten into spangles under the hammer.

TRANSPARENCY.—The following are the degrees of transparency, or transmission of light, as possessed by minerals: 0, Opaque. 1, Translucent on the edges. 2, Translucent. 3, Semi-transparent. 4, Transparent.

DEGREE OF LUSTRE is distinct from the kind lustre or aspect of minerals. The degrees of lustre are marked by the following numerals: 0, Dull, devoid of lustre. 1, Glimmering. 2, Glistening, or weakly shining. 3, Shining, as rock crystal. 4, Splendent, or strongly shining, as galena.

pearance of the surfaces produced on breaking a mineral in any direction, except in that of its natural joints or cleavage planes, which ought to be always smooth, and more or less shining.

Fracture is a character of minor importance; it is the absorbing.

Form, Frangibility, Flexibility, Touch, Soiling and Sound, are all terms which are sometimes employed to describe the characteristics of minerals, but as they of little importance to the general student, we pass them by.

Taste is a characteristic properly possessed by such minerals as are soluble in water.

Magnetism is a characteristic of limited application, but in many cases a very important one. The only metals which attract the magnet, are iron, nickel and cobalt; and there are very few that affect it in their natural state, but may do so after their exposure to the action of the blow pipe.

Electricity.—To ascertain whether a mineral possesses this character or not, a small instrument called an electrometer is necessary. Electricity is produced in minerals, either by heat or friction. To try if a mineral possesses the property of electricity, first rub it briskly for a few minutes with a woolen cloth, and then present it to one of the pith balls of the electrometer; or, heat it gently through and do the same; if in either case it attracts the ball, then it possesses electricity.

The effects produced on minerals by the action of acids, are very important. These effects are effervescence, solubility, partial solubility producing a gelatinous mass, &c. To develop these effects, the mineral should be reduced to powder, and placed in a small test-tube or other vessel, and the acid, either pure or diluted, must be gently poured over it. The application of heat is sometimes necessary, in which case a spirit lamp is made use of, and the mineral and acid supported over it in a test-tube, watch-glass, or small capsule of Berlin porcelain, or of platinum, by means of a thin bent wire.

The treatment of minerals by acids will be fully explained in its appropriate place.

#### MINERALS.

We have already described a mineral as an unorganized body, formed and enlarged by an increase of particles, externally; said particles being attached by mere *juxta position* instead of *assimilation*, as is the case with vegetable and animal organism. All solid substances therefore which possess neither vegetable nor animal life are mineral. All rocks are minerals, and the chief part of soils are mineral.

When a mineral has a metal of any kind associated with it, it is commonly called an ore—as an ore of silver, an ore of lead, copper, etc. Ores are usually found in veins, sometimes, however, in beds. A mineral bed usually lies horizontally, or at a very slight inclination. Lead, zinc and iron are often found in beds; gold, silver, copper, mercury, etc., very seldom.

#### MINERAL VEINS.

A mineral vein may be described as a fissure or crevice in the earth, more or less vertical, and filled with some kind of vein-stone, usually quartz, more or less mixed or impregnated with various metals, and when so mixed, called ores. Most metalliferous veins contain several varieties of metals. The veins of California and Nevada Territory probably contain a larger variety of metals than those of any other portion of the globe. Veins vary in width from a fraction of an inch to one or two hundred feet. They usually range from 10 inches to two or three feet in width. Of the origin of veins and the manner of their being filled, there are various theories. The opinions of practical and scientific writers on this subject are quite various. Some attribute these fissures to a process of cracking or opening of the earth in long fissures by some interior power of upheaval; others attribute their formation to a contraction of the earth's crust in the process of cooling or crystallization; others again suppose them to result from the action of electrical currents. Their manner of filling up is also a matter of great diversity of opinion. Intrusion, sublimation, deposition, infiltration from water, electrical agencies, etc., are among the most commonly entertained theories. The probability is that all the agencies named have contributed at times and in part in a greater or less degree toward preparing these valuable deposits, so indispensable to the progress of civilization and the arts. Our present purpose, however, being to treat upon facts, we shall leave all theorizing for the time being, and confine our remarks to simple facts and positive instruction. In future numbers we shall probably have something to say on the various theories above alluded to.

#### GENERAL LAWS OF VEINS.

Whatever their origin these veins (or lodes as they are sometimes and perhaps more properly called) are, as a general thing, found to obey certain general laws. They are usually contained within clearly defined walls, and are generally found in "sets" or "classes," each individual of any given set being approximately parallel to all others of its class. The different sets usually give evidence of different ages, the newest set being found to have disturbed or displaced the older in passing across it. The different sets are usually known by the general line of their direction as the "East and West set of veins," or the "North and South set of veins." They are usually found most productive near their crossings, also at any point where the vein enters a new class of rock, a change in its mineral productiveness may be

most confidently expected. The point where a "leader" or "string" comes in is usually improved by such contact. On the other hand a sudden enlargement of a lode, where it is not caused by the coming in of a feeder is almost invariably attended with comparative barrenness. The scattering of a lode into a number of small ones is almost universally unfavorable. They are, of course, of more recent origin than the rock which they traverse, through their general characteristics and richness in mineral is often much affected by their passage from one class of rock to another. This latter fact would seem to imply that, to a certain extent, they are dependent for their mineral value upon the mechanical condition of the rocks which they traverse.

#### TRUE VEINS.

As we have already stated, veins or lodes are found traversing all kinds of rocks, stratified and unstratified, often passing from one to the other. They are also sometimes found to traverse a space between two classes of rock, as between the slate and granite, metamorphic (rock changed by heat) and unchanged rock. Veins of this description are usually called "true veins," because they are much more reliable, more clearly defined, of greater linear extent, and generally much larger than veins having both walls composed of the same kind of rock. It is reasonable that these conditions should usually accompany veins of this description inasmuch as fissures between walls of dissimilar rock would naturally present less objections and disturbances and be more continuous in both length and depth, than fissures forced through a homogeneous mass of rock. True metalliferous veins are almost uniformly much more productive than other veins in the same neighborhood. The Comstock vein, in Washoe, is of this description. This is a condition in regard to quartz veins which should be more generally considered than has heretofore been the case in this country. It will, wherever it exists, be found to exert a most important influence on the productiveness and consequent value of the vein.

#### IGNEOUS INDICATIONS FAVORABLE.

Valuable metalliferous veins of ore are often found in secondary and even tertiary formations, yet as a usual thing, they are found more universally productive and most reliable when they occur in the older and metamorphic rocks. We have the proof of this in our own State and adjoining Territories. Those portions of California and the Eastern Slope, where is found the strongest evidence of ancient igneous action, have as a general thing, proved most valuable, in mineral development. Indeed, the idea has been advanced by some, that no metalliferous veins exist entirely disconnected with igneous rocks. It is claimed by the advocates of this theory that whenever surface indications are wanting, metamorphic rocks will invariably be found at no great depth below.

#### PECULIARITIES OF QUARTZ VEINS.

The study of quartz veins, to the mineralogist and miner, is most interesting and important, and one to which quite too little attention has been devoted in this country. In the hasty summary we are now giving, we cannot do the subject that justice which its importance demands; but in future numbers we propose to come back to this head and treat more fully upon it.

Few veins exhibit their true characteristics upon the surface. The action of water and the atmosphere, resulting in the oxidation of much of their contents, and other disturbing influences upon and proceeding from the surface, not unfrequently lead to serious fallacies in judging of a vein in the early stage of its development. An important consideration in the study of veins is the changes which they undergo in their passage from one class of rocks to another. This matter, so far as we have learned, has never been much considered on the Pacific Slope, although it has long been acknowledged as one of much importance in nearly all other mining regions. We append the result of a few observations under this head from various authorities.

De la Beche in his survey of Cornwall says that granite and its modifications is always found near or all locations productive of paying tin or copper mines; while lead, antimony, iron and zinc are found independent of and at a distance from granite.

In the Hartz mountains, veins passing from hard to soft slates lose much of their productive character; hard granites, as a general thing, are also found less productive than soft, or decomposed descriptions.

In the Copper mines of Lake Superior veins in hard greenstone are usually contracted and comparatively barren; but the same veins on entering the granular trap, a much more yielding material, becomes at once expanded, and improved in yield. This is especially the case with the celebrated Cliff and North American mines. The Copper Falls mine is highly productive and well defined in the trap, but on entering a belt of sandstone the vein is contracted to a mere fissure. Nearly all the veins of the Lake Superior region traverse different mineral planes, and in their passage through them are more or less modified, as noticed above. It will be perceived that instances above cited confirm the correctness of our previous remark with regard to the favorable nature of igneous rocks in mineral localities.

We have stated that veins are usually found in "sets" or clusters. California is no exception to this rule. The general direction of the older class of quartz veins in the auriferous districts on the western slope of the Sierra Nevada is

north and south; the east and west series of veins is more recent and may be called secondary.

Mr. Remond of this city, who has paid much attention to the geology of the quartz veins of this state, remarks that "the metalliferous character of the secondary quartz veins is worthy of note. They bear gold, often in crystallized form, which is very rarely the case in lodes running north and south. The numerous threads or minute veins crossing them contain much galena, in small leaf-shaped masses, and sometimes in cubic crystals, with more or less silver. These lodes also contain much white iron pyrites, with some arsenical and copper pyrites.

The following paragraph, which like the one above given, was written some two and a half years since, for *L'Echo de Pacifique*, and, prophetic at the time, has been fully verified by actual discoveries.

"The combinations of these different metals suggests the possibility of the discovery of silver mines. Some specimens taken from the quartz mines of Soulsbyville, resemble the argentiferous ores of Washoe. At Washoe the silver is mixed with lead, iron, arsenic, copper and a little antimony, all the metals being in a condition of sulphurets. At Soulsbyville, the iron and lead predominate, and the other metals are in smaller quantities, with a total lack of antimony."

No other portion of the world has been so carefully studied with reference to its metalliferous formations as Cornwall and Wales, and it has been asserted with much confidence, that a description of these veins would, generally speaking, suffice for those of every other portion of the globe. So far as their direction, length, depth, and dip are concerned, the assumption is doubtless quite correct, but with regard to their contents, we apprehend quite distinctive characteristics will be noticed. No one who has acquainted himself with the quartz veins on the two slopes of the Sierra, can have failed to notice most marked and distinct characteristics between the two. Other peculiarities may be noticed between those and the veins which are found far out toward the interior of the "Great Basin," and others still more marked when we reach the opposite rim of the Great Basin in the neighborhood of Pike's Peak, as will be seen from the following extract which we gave in our issue of April 20th, 1863, from a correspondent of the Territorial *Enterprise*.

"The Pike's Peak ores contain no quartz. They are iron pyrites, more or less mixed with copper pyrites, lead, antimony, etc. \* \* \* On sinking upon this no veinstone whatever is found. The vein is a simple crevice in the granite bed rock filled with pyrites."

In fact almost every vein has much that is peculiar to itself. Perhaps the most simple of metalliferous veins are those known as "gold-bearing," and it is to those, almost exclusively, until within a short period the miners of California have chiefly paid attention. Until after the wonderful developments of the Comstock lead in Washoe, not one prospector in fifty in California ever thought of examining a vein for any other mineral than gold, which is almost always found pure and free, and consequently readily known to the most unpracticed explorer. Hundreds of veins, in California, now known to be of the highest value in silver and copper, were, in the early days of our mining experience, passed by as worthless, simply because they did not "show gold" in working quantities.

Very few of our readers are ignorant of the ordinary indications by which the probable presence of quartz veins is noticed, or the manner usually employed in discovering their locality, or tracing their direction whenever found; hence we will not weary their patience by giving details so generally known.

In examining into the phenomena of quartz veins on the Pacific Slope, it should be borne in mind that but a very limited time has elapsed since the first efforts of mining were undertaken here. On the eastern continent and especially in Cornwall and Wales, mines have been wrought from time immemorial, and yet scarcely a year passes without adding some new fact to the great mass of information already stored up by the generations who have lived and died in studying the theory of those mines, the details of their structure, the relation of those veins to the various ores which they contain, and to the enclosing rocks, etc., etc.

Many of our citizens complain of the apparent dilatoriness of our State Geological Survey, from the fact that our miners are not already put in possession of facts for which English miners have patiently waited whole decades, and for which the English Government has paid an hundred fold more, than our Commission has yet asked for. Such persons cannot be aware of the difficulties and labors attendant upon the solution of the various problems presented in the investigation of so complex a subject as the study of such a wide and varied mining field as is found near and within the boundaries of the State of California.

#### COPPER.

The recent discovery of numerous and valuable veins of copper, throughout the entire length of the State, and the consequent especial degree of attention which is now being drawn to this new interest, has induced us to vary, to a certain extent, what would otherwise have been a natural procession of subjects, in such a paper as we have commenced. And in accordance with numerous requests to that end, we here present whatever may be attainable on the subject of copper, which can be of any practical value to prospectors after, or workers in that mineral.

## THE GEOLOGY OF COPPER.

In referring to the geological conditions under which copper is found, we shall commence with Cornwall, a district furnishing nearly one half of all the tin and copper produced on the globe. The rock in which the copper bearing ores of this region are found is principally clay slate, or *kilts*, as it is there termed. The country, however, is much broken up and diversified by obtrusive granites and elvans, which have been protruded through slates by igneous agencies from below. The general direction of the copper veins is east and west, and nearly at right angles with the tin lodes. The ores of copper and tin are seldom found in the same vein in Cornwall, and neither metal is often found in very great abundance at a less depth than 80 or 100 feet below the surface. Some copper veins in that district have been traced several miles—in one instance seven, without any evidence of discontinuance even at that point. No person has ever yet seen the bottom of a vein of either tin or copper. The ores found there are usually the yellow sulphuret of copper and iron, with which are associated at times, black, and gray sulphuret, red oxide, and native copper. The general average of these veins is about 2½ per cent., but which by dressing is actually brought to about eight per cent. before smelting.

FRANCE affords but one workable mine of Copper. Numerous mines have been wrought at various periods in the past, but, we believe, with the above exception, they have all been abandoned. The copper veins of this country are everywhere found associated with aluminous slates, more or less metamorphic, and among which, at frequent intervals, porphyritic rocks have been protruded. The mines at Chessy are directly at the line of junction of the granite and lias, (the latter a species of limestone.)

GERMANY.—The Copper Mines of the Hartz mountains occur in grauwacke slate in which numerous belts of trappean rocks have been obtruded. The mines of Rheinbreitenbach are in the same character of formation, and are productive in pyritous variegated copper.

SPAIN.—The general character of the deposits of this metal in Spain, is similar to those of the Hartz mountains.

In the Province of Hueloa is a district of much mineral wealth, the formation of which is clay-slate, traversed by numerous porphyritic eruptions, and it is near the line of contact of the slates and porphyry that nearly all the metalliferous veins occur—the most valuable being directly between the two formations, having a wall of schistose slate on one side and porphyritic granite on the other; the former usually composing the south wall and the latter the north wall of the veins. The veins are often found with both walls of porphyry, and sometimes, though infrequently, with both of slate.

PRUSSIA.—In the vicinity of Mansfield, in Prussia an interesting deposit occurs, known as the "Keeferscheifer," or copper slate—a thin layer of which occurs in magnesian lime stone. Throughout the entire body of this "copper slate" is disseminated gray argenteous copper ore.

Near Schemnitz, in Hungary, is an interesting metalliferous region, which produces about 5,000 tons of copper annually. The veins of this district are found altogether in porphyritic rocks, connected with sienites and passing into granites. The predominating vein rock is quartz and sulphate of barryta. The ores are pyritous and gray copper.

NORWAY AND SWEDEN.—The veins of these countries are almost exclusively confined to the gneiss and mica slate, more or less metamorphic from subterranean heat. The copper of this region is highly esteemed in consequence of its purity and freedom from arsenic and other metals.

RUSSIA.—The copper deposits of Russia, in the Ural Mts., are also remarkable for the purity and richness of their ores. The copper ores of this region are found chiefly in thin veins and nests of malachite, which lies in a broken, unconsolidated mass of detritus, overlying the surface of the upturned edges of limestone strata, intermixed or rather intercalated with ridges or ledges of trappean rocks. This malachite, though not in immediate contact with trappean rocks doubtless owes its origin, indirectly to igneous action, being probably a secondary product resulting from, cupriferous sublimation, accompanied by stalagmite deposition.

CUBA.—The copper deposits of Cuba, like those in the Ural Mountain region, are not in regular veins, but in masses, in immediate connection with igneous rocks, such as greenstone and serpentine. The gangue of these deposits is composed of quartz, and common white marble. The ore consists chiefly of yellow sulphurets, although blue carbonate of copper is not uncommon.

CHILE.—The copper mines of this country are very numerous and of great value. They exist chiefly in metamorphic granite, with veins of quartz and jasper.

IN AUSTRALIA the mines of copper are situated in an association of rocks quite similar to those formed in the Cornwall copper districts. The Barroosa district is in mica slate, similar to the killas (slates) of Cornwall. Through these slates, as in those of Cornwall, granites and sienites have been protruded, at frequent intervals. On the Copper Mine River, the enclosing rock consists of trap and sandstone, with occasional layers of limestone.

IN LOWER CALIFORNIA and Carmen Islands, we learn from verbal communication that the enclosing country of the copper veins consists almost altogether of igneous rocks.

From the above data it will be seen that copper ores are

found in almost all positions, from the most recent clay slates and detritus to granites, but invariably either in actual contact with or in the immediate vicinity of igneous or metamorphic rocks. Perhaps no metal presents more uniform evidence of an origin derived from an igneous agency than copper in its various ores. Of its origin we shall speak at a future time.

With the exception of iron no metal, used extensively in the arts, is more generally distributed than copper. There is scarcely a known country on the globe where it has not been found in workable quantities.

It is hardly necessary that we should occupy space in a journal for California readers, to direct them how to find or trace a mineral vein; yet a few brief hints to aid the prospector in determining when he has found a copper vein may not be out of place.

## TO TEST COPPER ORE.

Perhaps there is no characteristic of copper veins so general as their color. Whenever a mineral of a green or blue color is met with the presence of copper may be reasonably suspected.

A very simple and ready method to test the presence of copper in any ore is to drop a little nitric acid upon it, and after a short time dip a feather into the acid, and wipe it over the blade of a knife. If there be the least quantity of copper in it, the same will be precipitated on the knife. Perhaps a simpler mode than this cannot be named.

A Blow-pipe test may readily be made as follows:—Place a small piece of copper ore, with a little borax on a piece of charcoal, and apply the flame of a blow-pipe, when if any copper is present it will soon show itself in a small globule.

Again take a small quantity of the ore and pulverize it; place the powder in a small vial, add three or four times its bulk of nitric acid, which will soon dissolve the powder; then add a little water, and dip the point of a knife, or any piece of bright iron into the liquid. If copper is present the iron will be found coated with it.

## MUNDIC—PYRITES.

One of the most common characteristics upon and near the surface of a vein of copper is the appearance of large quantities of Pyrites—sometimes called Mundic. Whenever this mineral is so found, in great abundance, especially if in a region productive of copper, the miner may have the utmost confidence in prosecuting the work of developing his vein. Pyrites are most usually yellow, varying from nearly the color of gold to an iron white.

Pyrites sometimes contain, mechanically mixed, small quantities of gold. They are then called "auriferous pyrites." The gold mines of California contain large quantities of this description of mineral, and thousands of tons are now being worked for this metal. They are, here, usually concentrated from the sands which have passed through the ordinary gold processes. One of the most extensive and perhaps the most thorough establishments for working auriferous pyrites, is that carried on by Mr. Deetkin, a short distance from this city, on the San Bruno road.

Copper pyrites constitute the principal ore of that mineral, and frequently occur very massive, occupying the entire width of a vein, sometimes many feet in thickness, but oftener in strings and bunches comprising but a small percentage of the entire contents of the vein. Copper pyrites is not considered a rich ore. The yield of copper is usually from 8 to 20 per cent, rarely reaching 25. The richness of this ore may generally be pretty correctly estimated by its color. If of a fine yellow color and readily yielding to the hammer it may be considered a good ore; but if hard and of a pale yellow color it may be set down as a poor quality of ore. The color and consequently the value of this ore is attributable to the more or less abundant presence of iron.

## GOSSAN.

We hear much said among copper miners and prospectors for copper, about "gossan," and furthermore that the appearance of gossan is a good indication of copper—and so it is. The question is also often asked, "What is gossan?"

Gossan is nothing more nor less than decomposed mundic, or iron pyrites. It is usually of a yellowish color, sometimes, however, approaching to dark red. The more general composition of gossans oscillates between the two extreme results as given below:—

	No. 1.	No. 2.
Quartz.....	10	85
Water, etc.....	10	3
Oxides of Iron.....	80	12
	100	100

The term, gossan, originated in Cornwall, and for a time was local, but is now quite generally used in this country also. The existence of mundic or its common resultant, gossan, is not universal. In some rich mining districts no iron, or very little at most exists in the veins; in such, the ferruginous stain is wanting and gossan is not seen.

In California, we presume, from copper explorations thus far made, and from the general character of all our quartz veins, gossan will be almost universally met with, and wherever it or mundic is found, rich and valuable ores of copper, and possibly of tin may be confidently looked for at depths ranging from 15 to 100 feet beneath. Gossan, of itself, is generally of but little value. Although it sometimes contains small quantities of both gold and silver, and not unfre-

quently copper. It is often found, in small quantities, far down on the vein.

Beneath the gossan, we frequently observe appearances strongly reminding us of the common electrolytic process for procuring copper from a solution of sulphate of copper. The pure metal is gathered together in clinks, and cavities between the main mass of gossan and the body of the undecomposed copper pyrites, mingling perhaps with the lower part of the former. Sometimes this native copper, as it is called, may retain its metallic character; but at others it becomes converted into an oxide, and this again into a carbonate, by the percolation of waters containing common air and carbonic acid.

With regard to the formation of this native copper, it is probable that the sulphur, by a union with the needful oxygen, becomes sulphuric acid, and that, this formed, the copper is attacked and removed, to be dealt with like any other solution of the sulphate of copper.

We can hardly conceive it possible that the copper from a fluid state, has been forced up from below like dikes of porphyry or greenstone. An elastic force sufficient to raise a fluid mass of three times the density of lava would shatter the enclosing walls, and force the copper into the fissures. If this were its origin, we ought to find it occupying the depressions in the surface rocks in the vicinity of the fissures, like modern lava currents.

We find the copper investing various crystallized minerals, and every wave and stria of the pre-existing crystals is faithfully represented, it is impossible by any artificial method to cast this metal so as to exhibit such minute lines. They are as delicate and faithful as could be obtained by the electrolytic. Again the associated minerals do not exhibit the effects of a high temperature. Also, if the contents of the veins were the result of injection, their productiveness would be unaffected in their passage through different mineral planes. Lastly, copper and silver combine in indefinite proportions, forming homogeneous compounds; and yet we find them existing side by side a most chemically pure. Admitting that they once formed a homogeneous compound, it is reasonable to suppose that they have been separated by electro-chemical agency.

## COPPER ORES.

The ores of copper are quite numerous and present a great diversity of appearance, yet they are all very readily distinguished, each from the other, by certain unmistakable characteristics, which are rendered familiar by a very little attention. The presence of copper in any ore having been determined by the "test" above given, the character of the ore can, in most instances, be determined by the following description:

## CHARACTERISTICS OF COPPER.

The ores of copper are divided, by metallurgists, into 13 different classes, and each class is subdivided into many varieties. The richest of the ordinary ores appear under two general aspects: the first having a metallic lustre of copper red, brass yellow, iron or blackish gray, at times inclined to blue; the second is without metallic appearance, of a reddish color, verging upon purple, blue or green, the last being the most usual tint. The classes of ore most frequently occurring are Native Copper, Sulphuret of Copper as Copper Pyrites, Gray Copper, Sulphate of Copper, Carbonate of Copper and Arseniate of Copper. The most common are sulphurets and oxides, the former being the most abundant. Sulphuret of Copper occurs in all considerable copper districts, and is abundant in California. The color of this ore is a blackish lead gray, approaching, at times, to tarnished blue green. It is considered one of the richest ores, and generally occurs in very heavy veins.

Copper Pyrites greatly resembles in appearance, sulphuret of iron, common in the gold bearing quartz of this State. The color of the Pyrites is brass yellow, subject to tarnish, with greenish black streak and uneven fracture. Copper Pyrites are readily distinguished from iron pyrites, which they greatly resemble, by their inferior hardness; they may be cut with a knife, while iron pyrites will strike fire with steel. A marked difference may also be noticed in the effects of nitric acid upon the two substances. They do not form so rich an ore as sulphurets. The richness of the pyrites may generally be judged of by their color. If they present a fine yellow hue, and readily yield to the hammer, they may be considered a good ore; but if they are hard and of a pale yellow color, they are mixed with iron pyrites and consequently comparatively barren of copper and constitute a poor quality of ore.

Carbonate of Copper is of a blue or light green color, with pale green streak. It often occurs in beautiful green crystals. It is also known as Malachite. Green Malachite or Green Carbonate of Copper admits of a high polish like marble, and when obtained in large slabs, is often formed into tables, mantle pieces, etc.

Arseniate of copper is of various shades of olive green, and sometimes occurs in beautiful blue crystals. It readily melts before the blow-pipe, throwing off fumes of garlic odor. This ore is but little worked.

Gray Copper ore is of a steel gray color, more or less deep, either bright or dull. The value of this ore is often very materially increased by reason of the silver which it contains. It is generally accompanied, to a greater or less extent with copper pyrites.

Sulphate of copper (Blue Vitriol,) is similar to the arti-

cial salt of the laboratory. The water flowing from mines of this ore has a blue tint, caused by the solution of this salt. Copper is easily obtained from this water, in a metallic state by depositing pieces of scrap iron in it.

[The ores above named are about all the ores of copper worked to any considerable extent.]

Native Copper occurs in crystals, branches, and filaments, its most common locality being in primitive rocks. It is found abundantly in Siberia, at the mines of Tourinski, in those of Hungary, Sweden, Cornwall, &c. The gangues of native copper are granite, gneiss, mica-slate, clay-slate, quartz, carbonate or fluoate of lime, sulphate of barytes, &c.

Red oxide of Copper is deep red, sometimes very lively, especially when bruised. It is friable, difficult of fusion at the blowpipe, reducible on burning charcoal, soluble with effervescence in nitric acid, forming a green liquid.

Black oxide of Copper is of a velvet black, inclining sometimes to brown or blue; and it acquires metallic lustre on being rubbed. It is infusible at the blowpipe.

Hydrosilicate of Copper consists essentially of oxide of copper, silica, and water. Its color is green; and its fracture is conchoidal with a resinous lustre, like most minerals which contain water.

Diopside Copper, or Emerald Malachite; a beautiful but rare cupreous mineral, consisting of oxide of copper, carbonate of lime, silica, and water in varying proportions.

Phosphate of Copper is of an emerald green, or verdigris color, with some spots of black. It presents fibrous or tuberculous masses with a silky lustre in the fracture. It dissolves in nitric acid without effervescence, forming a blue liquid; melts at the blowpipe, and is reducible upon charcoal, with the aid of a little grease, into a metallic globule. Its powder does not color flame green, like the powder of muriate of copper.

Muriate of Copper is green of various shades; its powder imparts to flame a remarkable blue and green color. It dissolves in nitric acid without effervescence; and is easily reduced before the blowpipe. Its density is 3.5. By Klaproth's analysis, it consists of oxide of copper 73, muriatic acid 10, water 17.

The copper of Lake Superior contains about 3-10ths of one per cent. of silver. The copper of this State, mostly if not all, doubtless contains an appreciable quantity of both gold and silver. Of this we shall probably receive more definite knowledge when full returns are received from ores which have been sent East for reduction. A little metallurgical knowledge will be found of vast importance to the miner everywhere, and especially in California, where the mineral deposits assume such unprecedented profusion. Our miners according to present indications, will soon become as familiar with copper ores, as they have, for the last ten years, been with gold.

#### THE COMPARATIVE VALUE OF SOME OF THE MOST COMMON OF THE ORES OF COPPER.

Native Copper generally occurs almost pure, and in almost every conceivable form, as massive, granular, filiform (thread-like), arborescent, in thin laminae, etc. When found associated with other metals, such as silver, for instance, the two metals usually occur in juxtaposition, simply, and not combined, a condition which they readily assume when melted together in the crucible.

Sulphuret of copper is very rich ore, yielding copper 76.5; Sulphur 23; and iron 5.

Red Oxide of Copper is a very rare and rich ore. Very little, so far as we have learned, has yet been found in this State. When free from earthy impurities its yield is 88 @ 91 of copper, and 9 @ 12 of oxygen.

The Black Oxide of Copper, in its pure state yields from 70 @ 80 per cent. of copper. Both the black and red oxide yields readily in the reducing flame of the blowpipe a globule of copper.

Variagated Copper Ore (Peacock Ore) gives 50 @ 56 per cent. of copper, and promises to be quite common in the mines of this State.

Copper Glance, or Redruthite yields from 70 @ 75 per cent. of copper, when quite pure, and in that condition may be readily melted in the ordinary flame of the candle.

It sometimes, though rarely, occurs in connection with Bismuth, when it falls as low as 18 to 20 per cent.

Antimonial Copper is neither very common or rich. It yields 20 @ 75 per cent. of copper. An ore of the latter yield occurs on the Colorado, near Williams' Fork, in this state.

Green Carbonate of Copper (Malachite) in its pure state contains 75 per cent. of copper.

Blue Carbonate of Copper is usually a richer ore than the green and contains from 65 to 70 per cent. of copper.

Gray Copper, is a very rich and promises to become a quite common ore, in this State. Its yield of copper is from 40 @ 50 per cent. This often contains as high as ten per cent of silver, and sometimes a small quantity of quicksilver.

Copper Pyrites is the most abundant of the ores of copper and usually about the poorest. Its yield is greatly affected by the presence of iron and varies from 12 to 30 per cent.—rarely, however, reaching 25.

If tin is ever found associated with copper in California

it will probably be with this description of ore. When so found it is usually in about the following proportions:—Copper 30; tin 26; iron 14; sulphur 30.

#### INDICATIONS OF TIN PYRITES—ASSOCIATED WITH COPPER.

Tin Pyrites occurs massive, like copper; its lustre is metallic with streak black; color from steel-gray to iron-black, sometimes presenting a bluish tarnish, with an uneven fracture. When heated in an open tube it gives off sulphurous fumes, with a slight sublimate of the oxide of tin. On charcoal, with the blow-pipe, the sulphur is first expelled, after which a dark scoriaceous (pertaining to dross, like the dross or scoria of metals) globule is obtained. The charcoal will also be coated with the oxide of tin. With soda, a globule of iron ore copper is obtained.

This species of pyrites may be more confidently looked for in a granite rather than a slate region. Copper miners will do well to keep a good lookout for this mineral, as, if found it will be a valuable ore.

Arsenic Copper (Domeykite) which may be known by its reniform and botryoidal appearance, (reniform, having the shape or form of kidneys; botryoidal, shaped like a bunch of grapes) is a very rich, though somewhat rare, ore. It yields, when pure, about 70 per cent. of copper, and 30 of arsenic. Its composition sometimes varies so as to bring the copper as low as 60, with arsenic 20, and 20 parts of iron and sulphur.

Sulphate of Copper yields about 25 per cent. of metal, and occurs irregular in shape and, in three-sided crystals, with a glossy lustre, approaching the sky-blue, in lustre. This mineral is often found dissolved in the water which issues from the mine. The copper from these waters is obtained by precipitation with iron. At a mine in Wicklow, 500 tons of iron were laid at one time, in the pits into which the water was collected, and in about twelve months, this iron was all decomposed or dissolved, and each ton of iron was found to have deposited two and a half tons of a reddish mud, which was an oxide of copper, and which upon proper treatment yielded 15 cwt of pure copper to each ton of oxide.

#### MINING STATISTICS.

The value of mineral products in Great Britain, in 1855, amounted to one hundred and sixty-one million dollars, and when prepared for manufacturing purposes, \$190,000,000. The relative proportion of which coal appears to amount to 49 per cent.; clays, slates and sundries, 23; Iron 13 per cent.; Copper 8 per cent.; Lead 4 per cent.; Tin 1 per cent. The production of iron increased 300 per cent. in 28 years, ending prior to 1855, and amounting to 3¼ million tons. The average per cent. of copper for ten years, ending 1785, was 12 per cent.; for ten years ending 1855, 7½ per cent.; for 1857 was 6¾ per cent. These figures clearly indicate the economical value of improvements which have been effected in the working of the mines. The number of people employed in these adventures, was 304,000, of which 91,000 were females, and those under 20 years of age. The number of these adventurers 3,271 of which there is 172 copper vein leads, 330 tin, 156 residue of coal and iron mines. When we take into consideration the enormous amount that is realized to the Kingdom of Great Britain from her mineral resources who can predict the future of the Pacific coast, with the existing facts in view whilst the character of our mines is much richer and we can multiply their metallic veins by tens of thousands by the assistance of a Pacific Railroad and time sufficient to develop the resources. The Pacific slope will, in less than 26 years, produce more in value of the precious metals than the balance of the world.—[Marysville Appeal.]

SMOKEY CHIMNEYS.—A correspondent of the London Builder gives the following cure for a great and common evil:—

I have built many chimneys in all possible situations, and have found one simple plan everywhere successful; the only secret being to construct the throat of the chimney (the part just above the fire-place) so small that a man or boy can barely pass through it. Immediately above, the chimney should be enlarged to double its width, like a purse, to the extent of about two feet in height, and then diminished again to its former proportions. No chimney thus constructed will ever smoke.

THE COPPER SMELTERS of Swansea are crowded at the present time with orders. The recent advance in the price of copper has given a new impetus to the working of the mines. The mining interests of Great Britain, generally, were never so flourishing as at the present time. Burra copper is quoted at £100; Rapuda at £102 and Chili at £90. Iron has largely advanced with confirmed and increasing demand. Buyers in the metal market, at latest dates were operating freely, and there was every prospect of prices being maintained. Much confidence was also felt that a further and considerable rise will take place.

RIVERSIDE.—This is the name of a new "city" just laid out in Keys' Mining District, Owens's River, ninety miles south of Aurora, and fifty miles above Bend City.

#### PRICE OF GOLD.

We observe, says the *Mercantile Gazette* of the 22d inst. from the tenor of some of our recent Eastern exchanges that more reasonable views are being entertained in regard to the advance in Gold. Instead of attributing it so largely to the movements of speculators and heaping maledictions upon the "Gold mongers," they are now willing to admit that under all the circumstances, the marvel is not that Gold has advanced, but that it has not advanced more. The large adverse balance of trade—the light export requirement for our surplus products—the dwindling of Gold receipts from California—the continuance of large shipments of treasure from the Atlantic cities, the absorption of coin by Government for customs, and the increased issuance of paper are recognized as causes adequate to an advance of 30 ½ cent within a month. "Nothing," says the U. S. Economist, "but the hopes excited by our recent successes could have prevented a much greater advance than has actually occurred. All things considered the balance of probability indicates a continuance of high prices rather than a speedy fall to the late low range."

The demand for gold, on foreign account is very great at the present time, and an increased supply is thought indispensable to Europe. The Mexican War, the Polish insurrection, the generally troubled condition of Europe, the immense call for specie for the purchase of cotton in Egypt and India, and the increase in America of exports all combine to make the present demand for gold urgent in the extreme. There is at this moment a balance of about \$65,000,000 due the East which must be covered by remittances in specie. The recent advance of the rates of discount by the bank of England to eight per cent is mainly owing to this pressing demand.

The London Economist gives a much greater prominence to the drain of the precious metals to India and East, than does the Times. The imports of Raw Cotton from those countries during the current year, as compared with 1862 shows an excess of \$80,000,000 while the increased export of both Treasure and Merchandise in that direction is but 10 per cent of that amount. Silver is the favorite remittance to Oriental markets, and the demand for it has, in the opinion of the Economist, been the chief cause of the pecuniary pressure, which has advanced the rate of discount within a few months from 2 and 3 per cent per annum to 6 and 7 per cent, and 8 per cent, as we learn by the latest telegrams. The general Continental demand is ascribed by the Economist to the troubles in Poland, the disturbance in Hungary, the heavy expenses of the Turin and French Governments, and the critical condition of Germany in consequence of the unsettled state of the Holstein question. Public stocks have greatly declined at London.

RAISING WRECKED CARGOES AT THE EAST.—Apropos to the question of the possibility of raising the *Aquila*, comes the following from a late number of the Providence, R. I. Press, of a late date:

"The Medford Wrecking Company are pursuing their operations in this vicinity, raising the cargoes of wrecked vessels. The job they are now at work on is the raising of a cargo from the wreck of a vessel which drove into West Dumping Cove in a storm, ten years ago, and went down in four fathoms of water. Her cargo consisted of two hundred tons of heavy block granite, weighing several tons each; in the cargo were two blocks of hewn granite, worth \$500 each. For this cargo, or such portion of it as they may be able to raise, they are to receive \$4 per ton, delivered on Long Wharf. They operate by means of divers, provided with the usual submarine armor. There are four of these who relieve each other at regular intervals of two or three hours each. Having completed this job, there are two other cargoes of granite, severally on Beaver trail and Point Judith, which they design raising. During the last war with Great Britain, a transport loaded with brass ordnance was sunk in the harbor of Newport, the locality of which this company will endeavor to determine by explorations, with a view of raising the guns.

Action, by the Chamber of Commerce, upon the question of raising the *Aquila* has been suspended, for the present, on account of the reception of a dispatch to the effect that the Government and underwriters have come to an understanding with regard to the question of "liability." As soon as telegraph communication, which has been suspended for a few days, is once more opened, we may expect to see some decisive and energetic steps taken in the matter.

25,000 persons are engaged in Peru in obtaining india-rubber to supply the foreign demand.

Parties addressing this office should be particular to write the name 'MINING AND SCIENTIFIC PRESS' in full, to avoid all liabilities of mistakes.

**MINING AGENCY.**—By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to any particular mine at Reese River. Parties in the city about to invest in "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to avail themselves of the opportunity hereby presented in securing reliable information, previous to investment, at a moderate cost.

Persons already holding "feet" and desirous to learn through a disinterested source the actual condition of the mine in which they may be interested, will do well to embrace the opportunity here presented of securing the desired information.

We shall establish agencies similar to the above in all the principal mining districts, at an early day.

### A New and Valuable Book.

**Process of Silver and Gold Extraction,** by Guido Kustel, Mining Engineer and Metallurgist, former manager of the Ophir Works, &c.; 260 pages octavo illustrated.

This admirable work has met with the highest commendations from the Press and Scientific men, as a clear and able exposition of the science as practiced in California and Nevada Territory—it is written for the people in good plain English and finely illustrated.

(ARMORY HALL.)

### GENERAL NOTICES.

### WHEELER'S

**Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to flow the triturating loss is entirely avoided. To working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans have been in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. 2016-1f ZENAS WHEELER.

PUMPS!

HARRISON'S

California Lift and Force Pump,

WITHOUT VALVES OR PACKING,

Suitable for Mines, Fire-Engines, Wrecking or Irrigating. These are the Cheapest, Lightest and most durable, and least liable to get out of order, of any Pump yet invented.

ALL SIZES;

Capable of throwing from ONE HUNDRED to FIVE THOUSAND gallons per Minute—For sale by

C. H. HARRISON,

PHOENIX OIL WORKS,

10-15 617 Front Street, San Francisco.

50 lbs. MARINE and

Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

DIRECTIONS:

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil; if a lighter color is wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,  
G. T. FOURCIE, Superintendent.

WORKS, North Beach; Office, 500 Sacramento st., San Francisco.

HEPBURN & PETERSON'S  
AMALGAMATOR.

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

GOLD AND SILVER ORES,

manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the miner a more expeditious and perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machines now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Yaphy First Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

nov8 3m\* HEPBURN & PETERSON.

The public are informed that Letters Patent have been granted the undersigned upon Steam Chest False Bottoms for the inside of Amalgamating Pans or Tubs, and are cautioned against making, buying, using or selling the same without his consent. W. A. PALMER.

Miners' Foundry

—AND—

MACHINE WORKS,

First St., between Howard & Folsom,

SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the Best and Most Economical, manufactured in the state of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

\* Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere

HOWLAND, ANGEL & KING

San Francisco, February 23, 1863.

REYNOLDS'

Patent Cut-Off and Governor,  
FOR STEAM ENGINES.

127 of these Invaluable Machines,  
ARE NOW IN USE

in California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 65 per cent of the Fuel.

Steen's Improved Governor

is the CHEAPEST, SIMPLEST and QUICKEST to act and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street, San Francisco.

Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to a pound, on the square inch. It cannot get out of order and any person can put one up in an hour after the damper is put in.

Ingersoll's Patent Drill Press,

With which drilling can be done the same as with the common rechet, and when small holes are wanted, it can be done four times as fast. The handle can be worked in any direction.

Felt for Steam Boilers, Pipes, Etc.,

At the lowest market rates.

E. T. STEEN AGENT.

No. 33 Fremont Street, San Francisco.

THE  
BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most effective, Economical and Durable character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,  
San Carlos Mining Co., Owen's River,  
Union Quartz Co., Aurora,  
Triunfo Mining Co., Mexico,  
Napa Quartz Co., Aurora,  
Petaluma Quartz Co., Gold Hill,  
Francis Mellus & Co., Slate Range,  
W. R. Churchill & Co., Mexico,  
Willow Springs Co., Coso,  
Hews, Howe & Co., Rich Gulch Flat,

BOOK KEEPING,  
Penmanship

AND  
COMMERCIAL CALCULATIONS,

Taught by J. S. LUTY

PRACTICAL ACCOUNTANT.

305 Montgomery Street, Corner of Pine.

TO QUARTZ MINERS.

All persons interested in Mining Machinery are invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving miller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference: from whence it passes again over the miller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the miller, and reducing the whole mass to an insubstantial powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured.

## CROCKER'S STOCK AND ASSESSMENT LEDGER.

Copyright Secured—Price \$10.

The necessity of a proper book for keeping the Stock and Assessment accounts of Corporations has long been very much needed. One that would combine economy and simplicity, and would not require the services of an experienced book-keeper to keep the accounts correctly. CROCKER'S STOCK AND ASSESSMENT LEDGER, but met this requirement; we have submitted it to several Secretaries of corporations, and they acknowledge that the plan is admirable, and just what has long been wanted. The printed headings are a perfect explanation of the manner of keeping it; and any person, whether they understand book-keeping or not, cannot make an error in the accounts. The Stock and Assessment accounts are so arranged that the Secretary can at a moment tell how any stockholder's account stands, both in regard to Stock and Assessments. He can also, with the greatest ease, trace any certificate, through any number of transfers, to the original one issued. It saves a great amount of labor, as it does not require one-fourth the writing of the ordinary method. It dispenses entirely with the old style of Stock Ledger, Stock Journal and Assessment Book, all three of which Secretaries have heretofore been obliged to keep, condensing the whole in one book. To a person who is Secretary of several companies, this book will prove invaluable, and we feel no hesitation in guaranteeing satisfaction to those who may order them. Specimens of the book sent to those who desire to examine it. The books are ruled with one or two accounts to the page. State which is preferred.

Published and for sale, wholesale and retail, by  
**H. S. CROCKER & CO.,**  
Book and Job Printers, Sacramento.

**Certificates!**  
And complete sets of books for Corporations, in the finest style, at short notice, and low rates. 7-1m

## MINING NOTICES.

**Enterprise Copper Mining Company.**—Office 528 Montgomery street, San Francisco. At a meeting of the Board of Trustees of this company, held December 12th, an assessment of ten cents per share was levied, payable immediately, and another assessment of eight cents per share, payable January 1st, 1864, and another assessment of eight cents per share payable February 1st, 1864, all payable in U. S. gold coin, to Thomas S. Levy, the Treasurer, at Lincoln, Placer county, or to the Secretary, at the office of the Company.

By order of the Board of Trustees. M. G. ELMORE, Secretary.

**Wide West Copper Mining Company.** Office 528 Montgomery street, San Francisco, December 12, 1863. Notice is hereby given that assessment No. 2 of twenty-five cents was this day levied on each and every share of the capital stock of the Wide West Copper Mining Company, payable in U. S. gold coin, to the Secretary at the office of the Company, or to J. M. PIKE, Superintendent, Copopolis.

By order of the Board of Trustees. M. G. ELMORE, Sec.

**Emmett Copper Mining Company.**—Notice is hereby given that at a meeting of the Board of Trustees of the Emmet Copper Mining Company, held at their office, No. 528 Montgomery street, San Francisco, December 3, 1863, an assessment of twenty-five cents per share was levied upon each and every share of the capital stock of said Company, payable immediately in U. S. gold coin to the Secretary at the office of the Company, or to L. HONIGSBERGER, Copopolis.

By order of the Board of Trustees. M. G. ELMORE, Secretary.

**Mammoth Consolidated Gold & Silver Mining Co.,** Excelsior District, S. T.—Office 528 Montgomery St., San Francisco, Nov. 28, 1863. Notice is hereby given: there will be sold at Public Auction, at the office of the Company, in San Francisco, on Saturday January 9th, 1864 at 12 o'clock, M. of that day, to the highest bidder, for cash in U. S. gold coin, so many Shares of the Capital Stock of said Company standing in the names of the following shareholders as will be necessary to pay assessment No. 1, of ten (10) cents per share, duly levied thereon by the Board of Trustees on the 9th of May, 1863; also assessment No. 2, of thirty (30) cents per share, duly levied thereon by the Board of Trustees on the 27th of June, 1863, together with all the expenses of advertising and sale, unless said assessments are previously paid to M. G. Elmore, Sec. San Francisco, or to W. H. Dalrymple, Financial Sec., Aurora.
